WoS or Scopus?

The state of Finnish scientific research at the start of the 2010s according to international citation data

Abstract

This report describes the state of, and developments in, Finnish scientific research in the period 2000–2010. The report was produced with reference to publication and citation data in the Thomson Reuters' Web of Science (WoS) and Elsevier's Scopus databases. An appendix also contains a comparison of the data.

The WoS and Scopus databases mainly give a similar impression of developments in Finnish science. The number of Finnish publications rose by a quarter in the last decade. Over the three-year period 2008–2010, the number of publications according to WoS was 29,000, and, according to Scopus, around 30,000. These are publications that include at least one author representing a Finnish research organisation (non-fractionalised figures). If co-publications are fractionalised according to the number of the countries of the writers contributing to them, Finnish writers account for 20,500 and 21,600 of all publications respectively (fractionalised figures). The fact that the number of non-fractionalised publications has grown faster than the number of fractionalised ones shows how Finnish publications are increasingly appearing as a result of international cooperation in research.

Despite the increase in the number of publications, Finland's contribution to global scientific publications has declined. According to the WoS data, it accounted for 0.71% in the period 2000–2002, but between 2008 and 2010 it was just 0.57%. The corresponding figures from Scopus are 0.69% and 0.53%. This decline is partly due to the rapid growth in the number of global publications, especially since China and India are now a greater presence in the market for scientific publications than before.

According to WoS, Finland's citation and the Top10 index have started to rise again, having shown a downward trend in the early 2000s. The citation index calculated with reference to Scopus data, meanwhile, is rising moderately, though steadily, and the Top10 index indicates a rise in the mid-2000s. The citation index is a reflection of the international impact of research. The Top10 index, for its part, indicates whether the research conducted by an examined unit (country, university, research institute) achieves a share among the total number of publications of the 10% that are cited most. Both indicators in this report are so structured that an examined unit is well placed in an international comparison if the indicator attains a value that is greater than 1. The upward trend in indicator values would suggest that Finnish science is moving in a

positive direction, but that is at least partly influenced by structural changes in progress in global data,

the most significant of which are the increase in contributions from China and India and the decrease in those made by the United States.

The greatest changes to publication numbers, if examined for each main scientific discipline, are the smaller contribution on the part of medical and health sciences and the greater one made by the social sciences. The citation indices for disciplines have reflected the general trend in the citation index. The agricultural and forestry sciences and medical and health sciences are faring the best. The impact of biological and environmental sciences, natural sciences and engineering and technology also exceeds the world average. The citation index for social sciences is below the world average.

Viewed from the perspective of research organisation type, it is universities that produce the majority of publications. They accounted for two-thirds (WoS)/three-fifths (Scopus) of all Finnish fractionalised publications. Publications by state research institutes and university hospitals both account for a good tenth of the total number of publications. Other more notable organisations that publish include hospital districts and companies. Universities of applied sciences, however, account for less than 1% of all publications. By the end of the decade, all the research organisation types apart from companies had a citation index above the world average

The highest values on the citation index for individual research organisations that are biggest in terms of number of publications were obtained by the National Institute for Health and Welfare, Kuopio University Hospital and the University of Helsinki.

In a comparison of OECD countries Finland's position had declined, although both its citation index and Top10 index positions were slightly stronger in the period 2008-2010 than they had been in the early part of the decade. At the start of the 2000s, Finland was in 8th position on the WoS citation index and 9th on the Top10 index. The corresponding positions in the most recent period were 13 and 14. The Scopus data showed Finland's position as 9th place on both indices at the start of the 2000s and 13 and 12 on the citation index and Top10 index respectively in the most recent period.

Almost half of the Finnish publications in the period 2008-2010 were produced in collaboration with foreign research organisations. The share of international co-publications grew in the 2000s in all scientific disciplines. Collaboration has a particularly important role to play in the natural and medical sciences. The share of international co-publications in the humanities is significantly lower than with other disciplines.

From the perspective of the main scientific disciplines of Finnish research organisations, the indication is that the University of Helsinki is the leader in all disciplines as regards numbers of publications, with the exception of engineering and technology and natural sciences. It is Aalto University that produces the greatest number of publications in the field of technology. According to WoS, Aalto University also produces almost as many publications on natural sciences as the University of Helsinki, and even more, according to Scopus. In the area of medical and health sciences, the University of Helsinki shares the leading position with the Helsinki University Central Hospital.

According to the WoS data, the highest values on the citation index for the impact made by research were received by the University of Helsinki together with Aalto

University and the University of Jyväskylä in natural sciences. The highest citation index value for biological and environmental sciences was obtained by the National Institute for Health and Welfare. In engineering and technology, Åbo Akademi University, Aalto University and the University of Oulu were in first place. On the citation index for medical and health sciences, the highest values were obtained by the National Institute for Health and Welfare, the University of Oulu, Turku University Hospital, the University of Eastern Finland and Helsinki University Central Hospital. MTT Agrifood Research Finland held first position in agricultural and forestry sciences, and Aalto University and the University of Turku in social sciences.

The Scopus citation index gives first place in natural sciences and biological and environmental sciences to the University of Helsinki, in engineering and technology to Åbo Akademi University and Aalto University, in medical and health sciences to the National Institute for Health and Welfare and the University of Eastern Finland, and in social sciences to the University of Turku, the University of Jyväskylä and Aalto University.

1 Introduction

This report describes the state of, and developments in, Finnish scientific research in the period 2000–2010. The aim is also to compare the data sets in WoS with those in Scopus. The report was compiled by a working group set up by the Ministry of Education and Culture. The working group consisted of:

- Olli Poropudas, Ministry of Education and Culture
- Anu Nuutinen, Academy of Finland
- Janne Pöllönen, Federation of Finnish Learned Societies
- Yrjö Leino, CSC – IT Center for Science Ltd
- Paula Mikkonen, National Library of Finland
- Hanna-Mari Puuska, CSC – IT Center for Science Ltd

The report is based on the publication and citation data in the Thomson Reuters' Web of Science (WoS) and Elsevier's Scopus databases. Both databases contain references to millions of scientific publications, such as the publication's name, its authors, their affiliations (information on the research organisation an author works for), the disciplines a publication represents, the type of publication, the year it appeared and the sources used. This information serves to calculate indicators that can be used to assess the scope and impact of the scientific publishing activity of research organisations.

Publications cited in the WoS and Scopus databases cover several hundred scientific fields. In this report, however, they are grouped into seven main *scientific disciplines* (see Appendix 1 for the classification). They are

- natural sciences
- biological and environmental sciences
- engineering and technology
- medical and health sciences
- agricultural and forestry sciences
- social sciences
- the humanities

The numbers of publications shown and the citation indices are generally based on fractionalised publication numbers. Non-fractionalised publications refer to publications whose author represents at least one examined unit (country, university, research institute). The fractionalised publication number is obtained by dividing co-publications among the participating units.¹

The scientific impact of the publishing activity of a research unit (e.g. a research organisation, a main scientific discipline) is represented in the relative citation index². The relative citation index gives a picture of the international impact that the research has had. It is calculated by dividing the number of

¹ For the applications undertaken with regard to the different examined units, see Appendix 3.

² In chapters 2, 3 and 4 the shorter concept of the *citation index* is used instead of *relative citation index*.

citations for a publication by the average number of citations for all publications for the discipline in question. If a publication attracts as many citations as the average for that field, its citation index will have a value of 1. If the number of citations is greater than the average, the citation index value will be greater than 1. If the number of citations is below the average for the field, the citation index will have a value less than 1. A publication is regarded as having a greater impact the more its value exceeds the average citation value for the field.

An examined unit whose relative citation index is high also always releases publications that have no citations whatsoever. Equally, a unit with a low relative citation index may employ research groups that repeatedly publish a large number of articles that attract citations. To assess the contribution made by these top publications, the *Top10 index* is used. The Top10 index indicates whether the research conducted by a unit achieves a share corresponding to the total number of publications for that unit of the 10% that are cited most. As with the relative citation index, a Top10 index value of 1.0 also means that the share of top publications in the research unit's output is equal to the world average, and index values greater than 1.0 mean that the share of top publications in its output is greater than 10%.³

Research units are examined by research organisation and research organisation type (Appendix 2). Research organisation types are the following:

- universities
- universities of applied sciences
- state research institutes
- university hospitals
- other hospital districts
- companies

Of these research organisation types, it is universities, state research institutes, and university hospitals that are examined in more detail here. For other organisation types, only the publication numbers are

given. With respect to indices that reflect impact, no results are reported if the unit being analysed does not produce more than 100 publications in total in the three-year period covered (see appended tables). This is because the indicators for small units can fluctuate greatly from one year to the next, for example when one publication among a whole group attracts a large number of citations.

The state of Finnish scientific research in 2010 is examined with reference to the Web of Science in chapter 2 and Scopus in chapter 3. In chapter 4, the pictures provided by the data are compared. Appendix 3 contains a more detailed description of the data processing methods employed.

³ For more details, see Appendix 3.

2 The state of Finnish scientific research in 2010 according to the Web of Science

Total number of Finnish publications and their international impact

The number of Finnish WoS publications rose steadily in the past ten years (Figure 2.1). Over the three-year period 2000–2002, the number of publications was around 23,000, but in the period 2008–2010 it was around 29,000 (non-fractionalised

figures). If co-publications are divided according to the number of the countries contributing, Finnish contributions account for 17,600 and 20,500 of all publications (fractionalised figures). The fact that non-fractionalised figures have grown faster than fractionalised figures is a reflection of the ever greater number of Finnish publications that are being released in the context of international co-publications.

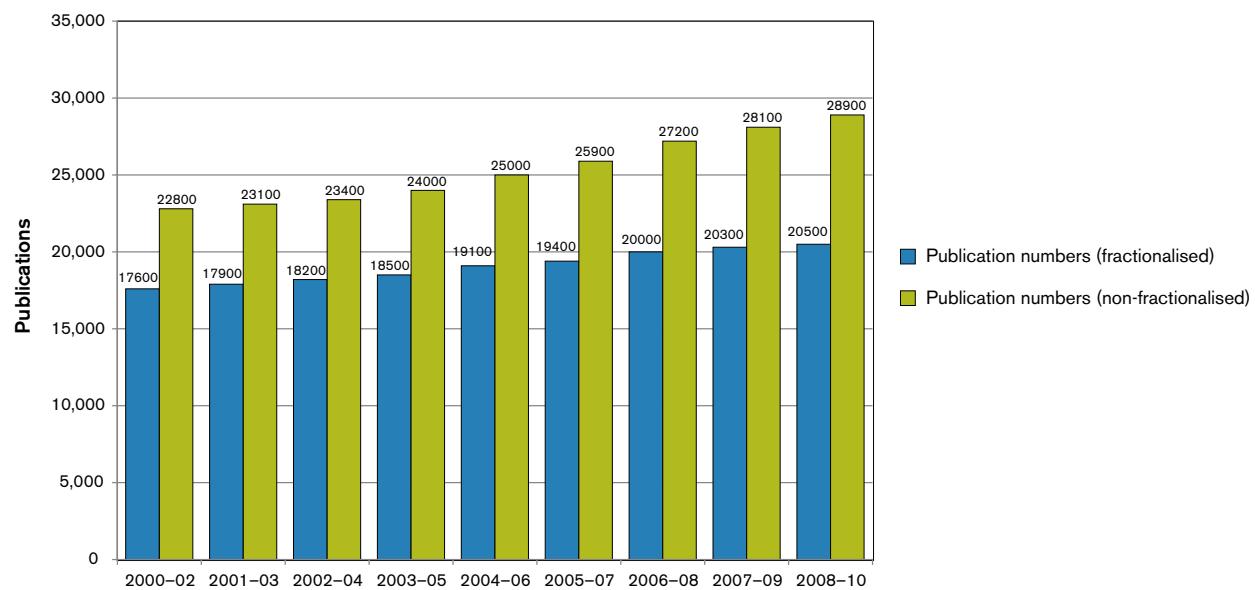

Figure 2.1. Trend in the number of Finnish publications in the period 2000–2010 according to WoS.

Despite the increase in the number of publications, Finland's contribution to global scientific publications has declined (Figure 2.2). It accounted for 0.71% in the period 2000–2002, but between 2008 and 2010 it was just 0.57%. This decline is partly due to the rapid growth in the number of global publications, especially since China and India are now a much greater presence in the market for scientific publications. Finland's citation and Top10 indices have started to rise again, having shown a downward trend in the early 2000s (Figure 2.3). The upward trend in indicator values would suggest that Finnish science is moving in

a positive direction, but this is also influenced by structural changes in global output.

Trend by scientific discipline

Examined on the basis of scientific discipline, most publications are on the subject of medical and health sciences, which accounted for 32% of all the publications registered by Thomson Reuters in the three-year period 2008–2010 (Figure 2.4). Other major disciplines mentioned in this data and in the classification of scientific disciplines used are natural sciences and biological and environmental sciences.

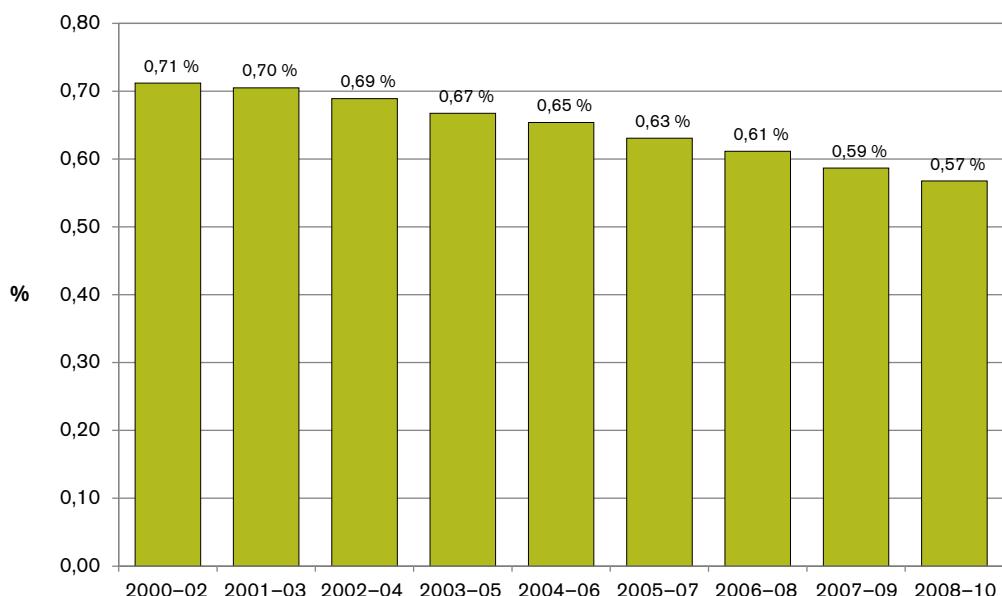

Figure 2.2. Finnish share of world publications 2000–2010 according to WoS, % (fractionalised publications)

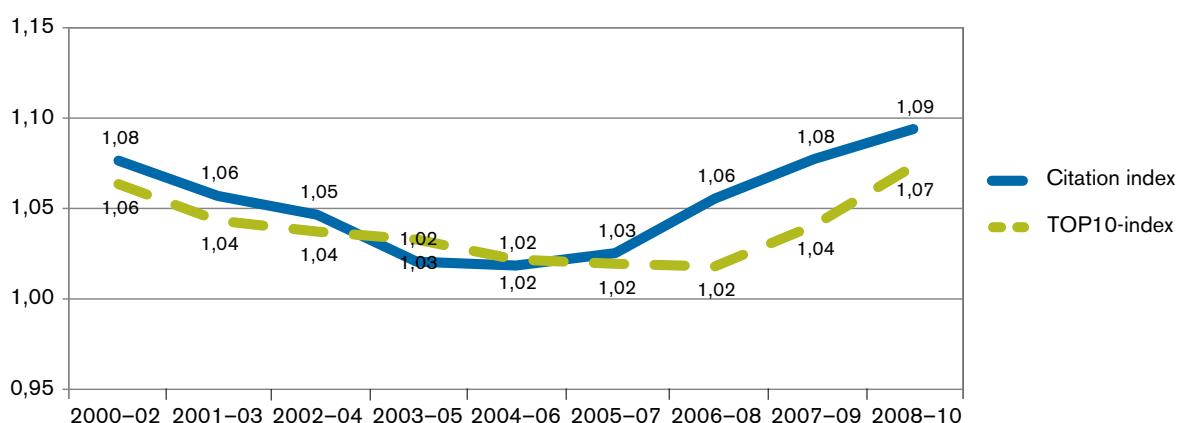

Figure 2.3. Finland's citation index and Top10 index 2000–2010 according to WoS

The greatest change in the 2000s is the fall in the contribution from medical and health sciences by six percentage points and the corresponding rise of four percentage points in social sciences.

The citation indices for the main scientific disciplines have reflected the general trend in the citation index (Figure 2.5). The citation indices for all the main scientific disciplines rose in the latter

half of the decade, having fallen in the first half. It is the agricultural and forestry sciences and medical and health sciences that are faring best. The impact of biological and environmental sciences, natural sciences and engineering and technology also exceeds the world average. The citation index for social sciences is below the world average, but is now rising in that direction.

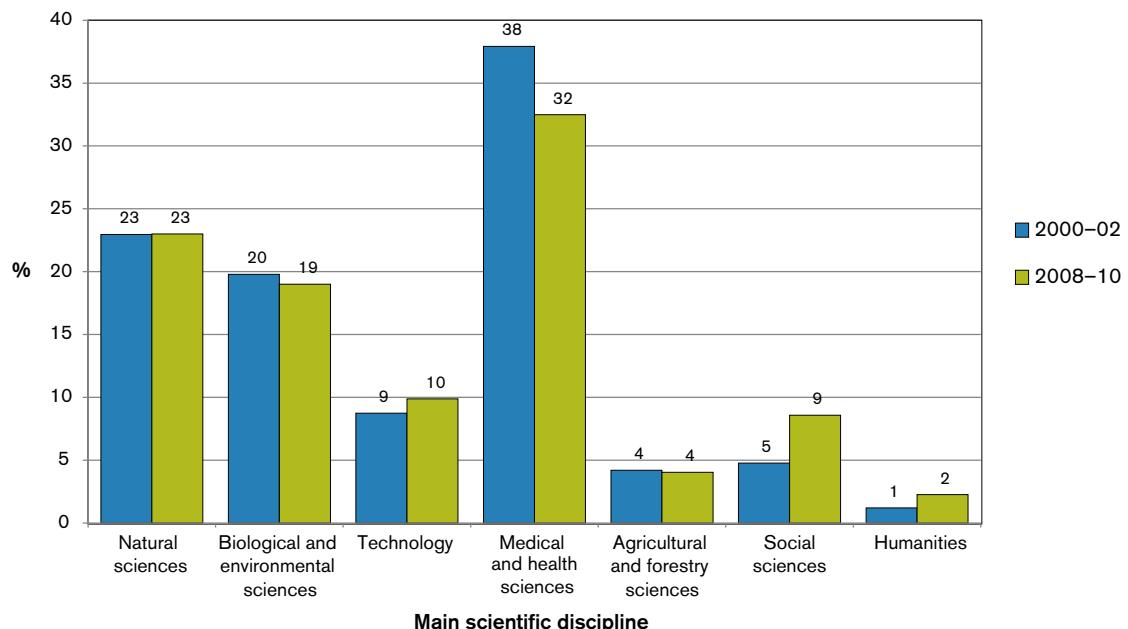

Figure 2.4. Contributions made by the main scientific disciplines to Finnish publications (fractionalised) in the periods 2000–2002 and 2008–2010, according to WoS, %

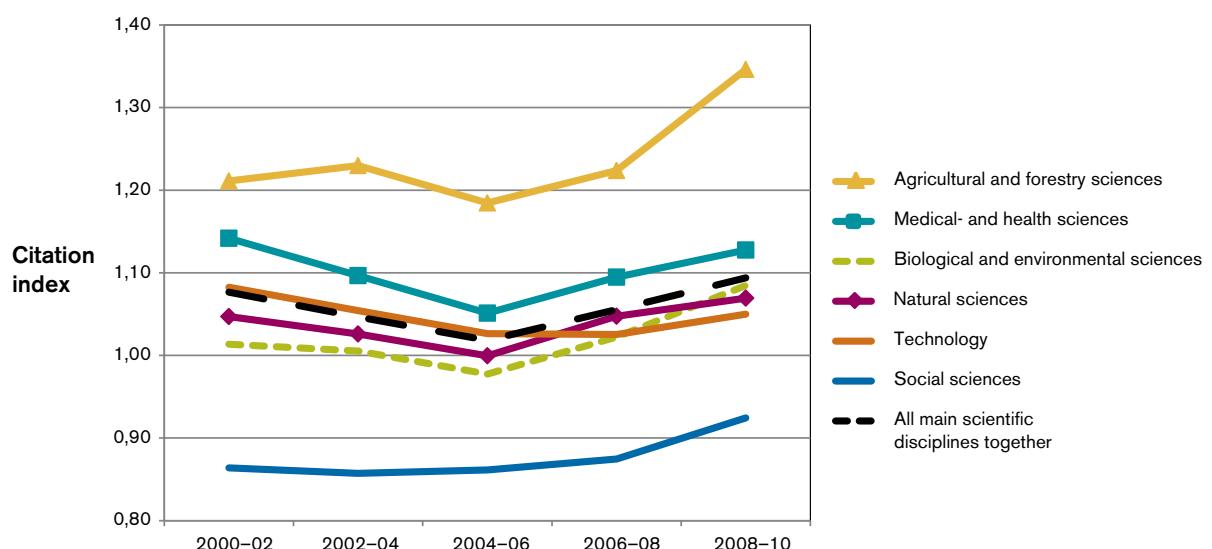

Figure 2.5. Citation index for the main scientific disciplines that are biggest in terms of publication numbers 2000–2010 according to WoS, %

Research organisations

Among research organisations the greatest number of publications is produced by the universities – 13,200 in the three-year period 2008–2010 (Figure 2.6). They account for 64% of the total (Figure 2.7). The number of publications from state research institutes was 2,600 (12.7%), and from university hospitals 2,300 (11.4%). The figures for universities and state research institutes rose in the 2000s. Publication numbers for hospital districts and companies remained

under the one thousand mark. Universities of applied sciences accounted for just 0.4% of all publications by the end of the decade.

The citation index for research organisations showed the same trend in the 2000s as the citation index for the whole country: fairly high values at the start of the decade that dipped halfway through the period and then rose again later (Figure 2.8). By the end of the decade, the citation index for universities and state research institutes was close to 1.10 and for university hospitals it was slightly higher.

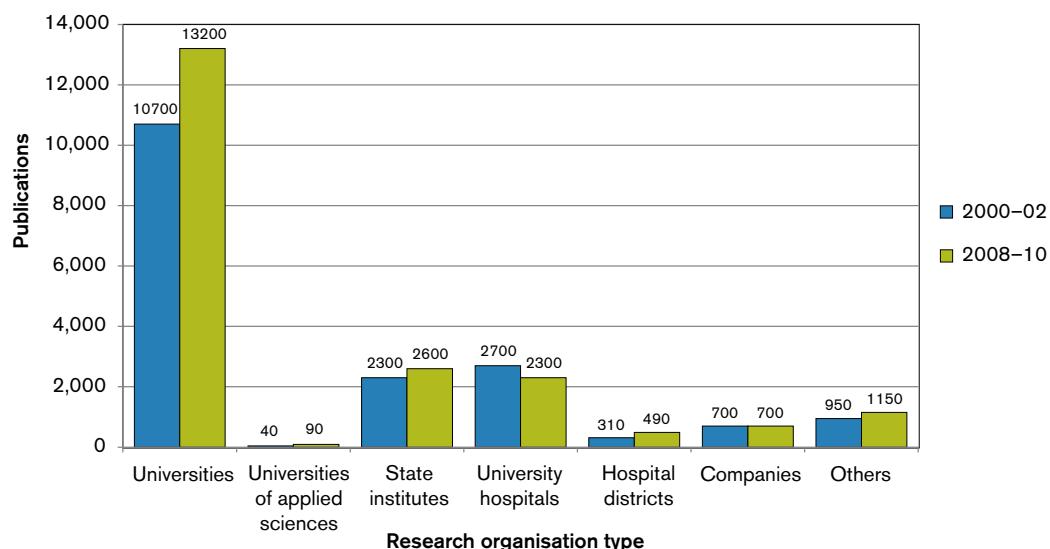

Figure 2.6. Number of publications (fractionalised) by research organisation type 2000–2010, according to WoS

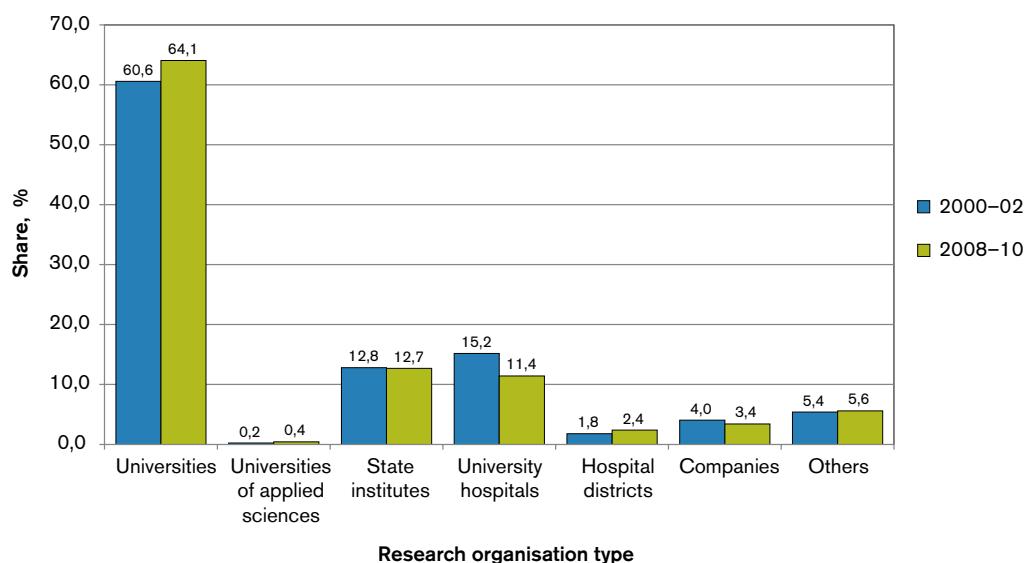

Figure 2.7. Contributions by research organisation type to Finnish publications 2008–2010, according to WoS, %

The relative citation index for companies remained below 0.95 throughout the decade.

The highest citation index for research organisations that are the biggest in terms of their publication numbers is that for the National Institute for Health and Welfare (1.40), and the second highest is for MTT Agrifood Research

Finland (1.39). Kuopio University Central Hospital comes next (1.24) and in fourth place is the University of Helsinki (1.22). The following also have positions above the world average: the University of Eastern Finland, Åbo Akademi University, the University of Oulu, Aalto University, and the University of Jyväskylä.

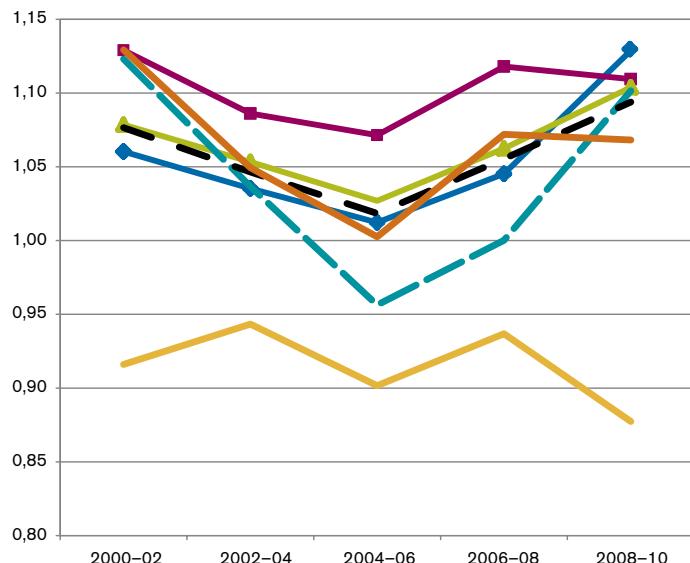

Figure 2.8. Trend in the citation index by research organisation type 2000–2010, according to WoS

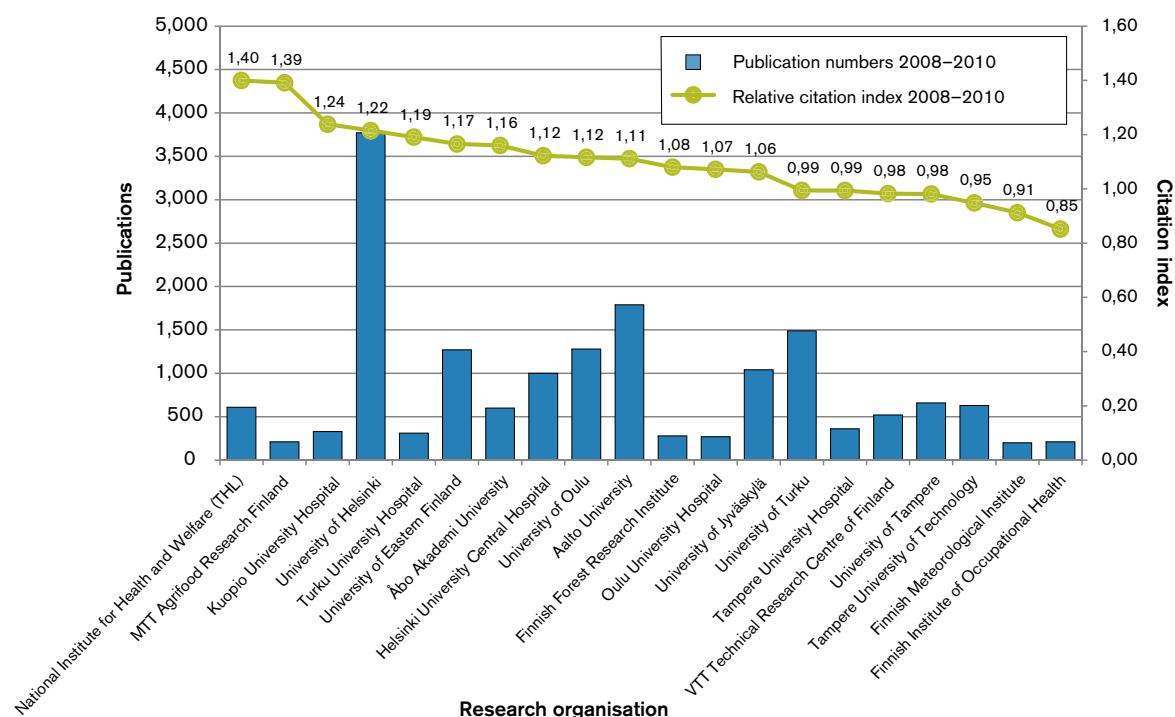

Figure 2.9. Citation indices for the biggest research organisations 2008–2010, according to WoS NB. The diagram gives the data for the 20 research organisations that are biggest in terms of their publication numbers.

Finland's position in an international comparison

In a comparison of OECD countries, 18 were in an average position or above it on the citation index and the Top10 index globally in the period 2008–2010 (Figures 2.10 and 2.11). The four leading countries were Switzerland, the Netherlands, Denmark and the United States. The citation indices for all countries compared, apart from the United States and Iceland, were higher in the period 2008–2010 than at the start of the decade. The same was also true of the Top10 index. Sweden's Top10 index remained the same in both review periods.

An examination of Finland's position using the citation indicators shows that global competition in publishing grew more intense in the 2000s.

Finland's position declined in the comparison of OECD countries, although both the Finnish citation index and its Top10 index were in a slightly stronger position in 2008–2010 than at the beginning of the decade (Figure 2.12). Finland ranked 8th (citation index) and 9th (Top10 index) at the start of the 2000s. The corresponding positions in the most recent period were 13 and 14. Overtaking Finland in the 2000s were Belgium, Ireland, Norway, Germany and Australia, when positions in both comparisons are examined.

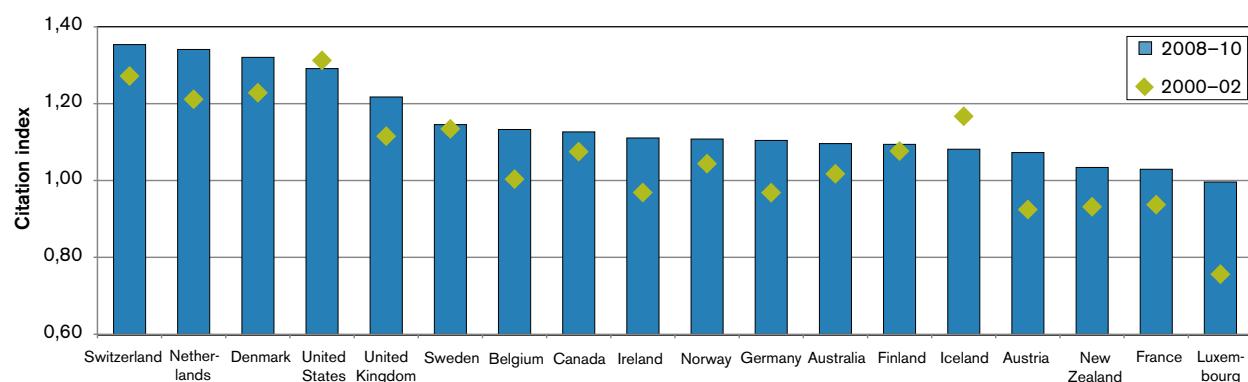

Figure 2.10. Citation index for OECD countries in average position or above on the global scale in the most recent period 2000–2002 and 2008–2010

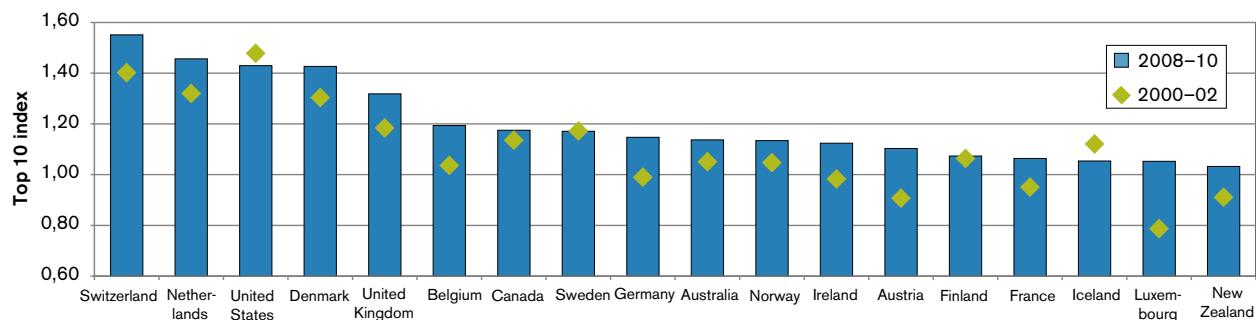

Figure 2.11. Top10 index for OECD countries in average position or above on the global scale in the most recent period 2000–2002 and 2008–2010

Internationalisation of Finnish science

Most research is conducted outside Finland, so international cooperation is very important for Finnish science. Almost half of the Finnish publications in the period 2008–2010 were produced in collaboration with foreign research organisations. The proportion of international co-publications increased from the start of the

2000s in all scientific disciplines. Collaborations are highly significant in natural and medical sciences, in which a major part of research is published in general scientific magazines. The share of international co-publications in the humanities is far smaller than with other disciplines (Figure 2.13).

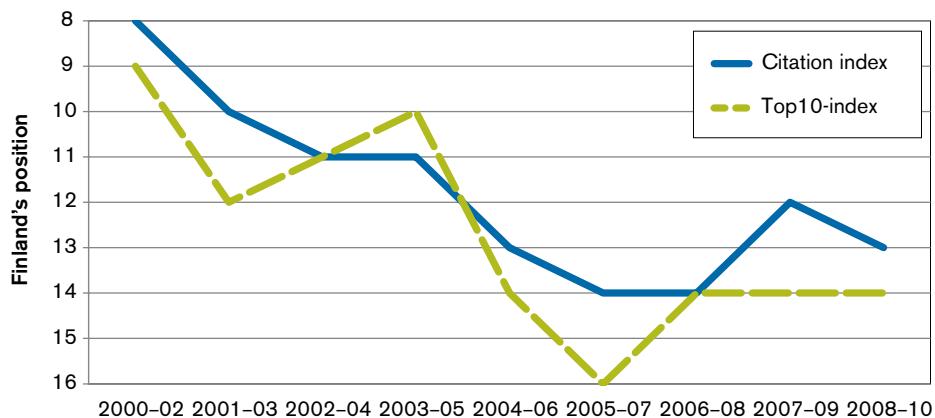

Figure 2.12. Finland's position in a comparison of the relative citation indices and Top10 indices for OECD countries 2000–2010

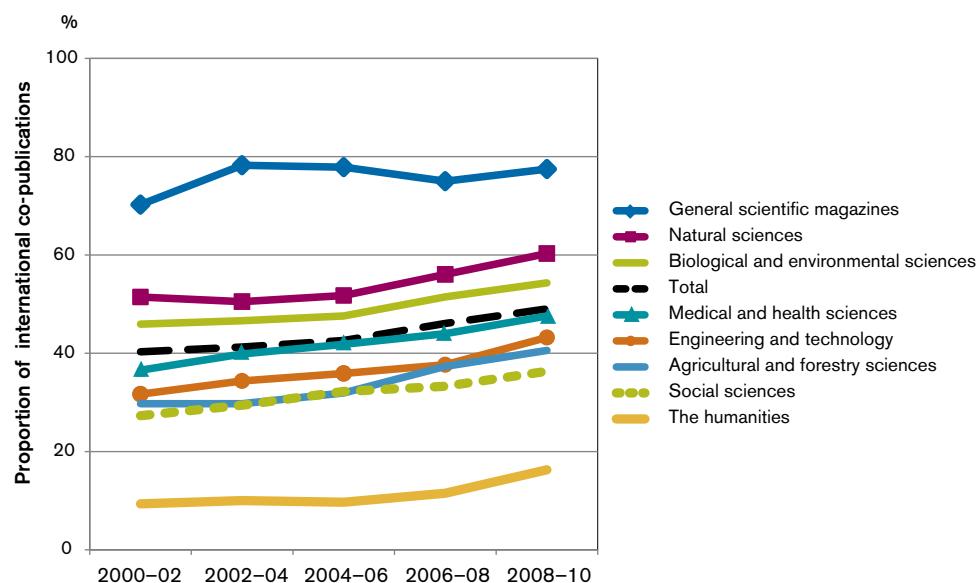

Figure 2.13. Proportion of international co-publications by scientific discipline 2000–2010.

Research organisations by main scientific discipline

The diagrams for individual main scientific disciplines (2.14–2.19) give the number of publications and the citation index for all those research organisations that released more than 100 publications in the scientific field under scrutiny in the period 2008–2010. The position of a research organisation in the period 2008–2010 is indicated by a coloured ball that moves along the vertical axis to reflect the citation index and along the horizontal axis to represent the number of publications. The size of the ball, furthermore, is determined by the number of publications. The lighter-coloured ball represents the number of publications and the citation index for a research organisation in the period 2000–2002. A comparison of the situation in 2008–2010 with that in 2000–2002 reveals how the position of the various research organisations changed over the whole decade.

The University of Helsinki publishes more than the others in the field of natural sciences, and it achieves the highest citation index of all Finnish research organisations together with the University of Jyväskylä, which has seen the most dramatic rise. Other organisations that achieved a citation index that is higher than the world average include Aalto University and the Finnish Meteorological Institute, even though their citation index fell. At the same time, Aalto University almost caught up with the University of Helsinki in the number of publications devoted to natural sciences.

The University of Helsinki stands out as the clear leader for publications in biological and environmental sciences. But the National Institute for Health and Welfare, whose number of publications is almost ten times smaller, rose on the citation scale to a point that was much higher than even that for the University of Helsinki.

In engineering and technology, Aalto University increased its lead as the largest publisher compared to the other research organisations. The citation index for publications of Åbo Akademi University climbed to outstrip Aalto in the 2000s. Meanwhile, the citation index for the University of Oulu fell

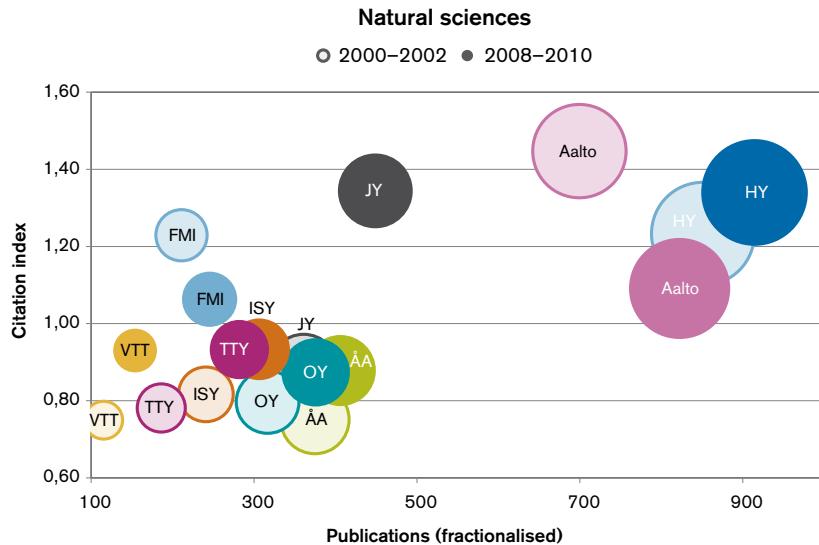

below the figure for Aalto, though remaining above the world average.

In medical and health sciences, Helsinki University Central Hospital and the University of Helsinki publish more than the others. The highest citation index value is achieved by the National Institute for Health and Welfare. Furthermore, the University of Oulu, Turku University Central Hospital, University of Eastern Finland, the University of Turku and Kuopio University Central Hospital achieved higher citation index values than Helsinki University Central Hospital and the University of Helsinki, or values as high as the last two institutions, clearly exceeding the world average.

In agricultural and forestry sciences, the University of Helsinki publishes more than the others. The highest citation index value is attained by MTT Agrifood Research Finland. The citation index for the University of Eastern Finland and that for the Finnish Forest Research Institute (Metla) also exceed the world average.

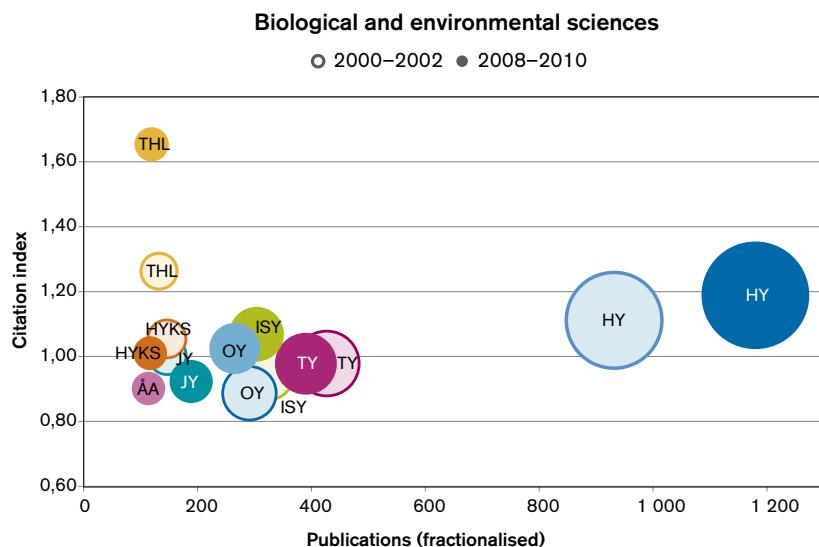

The University of Helsinki publishes the most with respect to social sciences, though during the 2000s, four other universities produced 100 publications on social sciences. The highest citation index values are attained by Aalto University, the University of Turku and the University of Jyväskylä.

In the humanities, only the University of Helsinki produced more than 100 publications in the period 2008–2010.

3 The state of Finnish scientific research in 2010 according to Scopus

Total number of Finnish publications and their international impact

The number of Finnish Scopus publications rose steadily in the last decade (Figure 3.1). Over the three-year period 2000–2002, the number of publications was around 22,000, but in the period

2008–2010 it was 30,000 (non-fractionalised figures). If co-publications are divided according to the number of the countries contributing, Finnish contributions account for 18,200 and 21,600 of all publications (fractionalised figures). The fact that non-fractionalised figures have grown faster than fractionalised figures

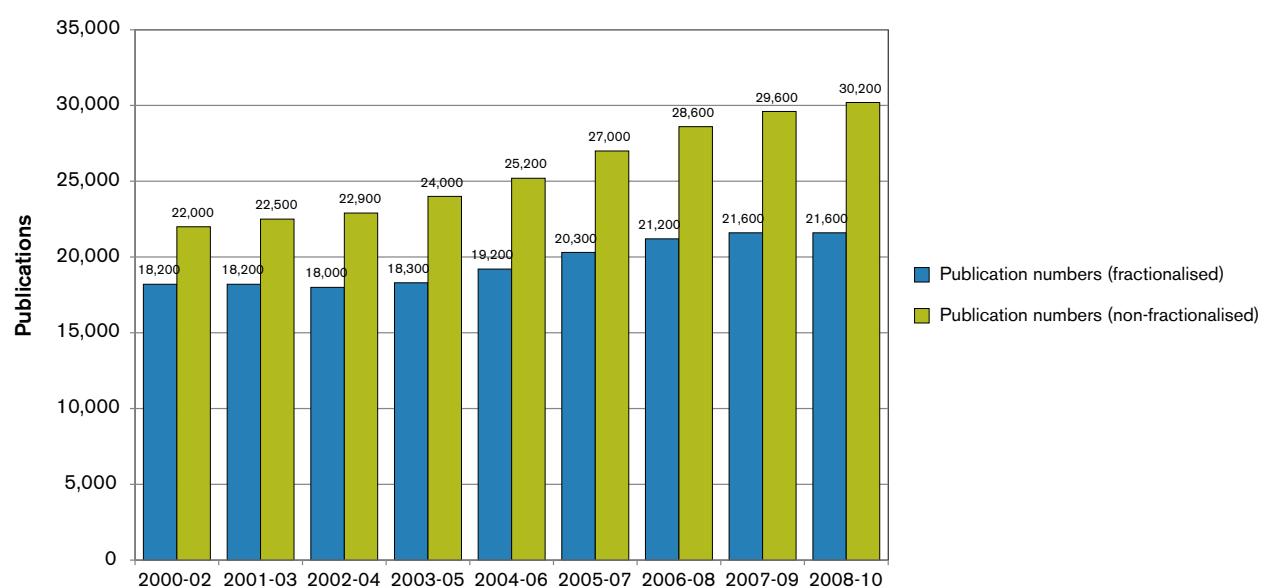

Figure 3.1. Trend in the number of Finnish publications in the period 2000–2010 according to Scopus.

Despite the increase in the number of publications, Finland's contribution to global scientific publications has declined (Figure 3.2). It accounted for 0.69% in the period 2000–2002, but only 0.53% between 2008 and 2010. This decline is partly due to the rapid growth in the number of global publications, especially since China and India are now far more of a presence in the market for scientific publications than before.

Both the citation index and the Top10 index have seen slight rises over the 2000s, although the rise in the Top10 index was more robust (Figure 3.3).

Trend by scientific discipline

Examined on the basis of scientific discipline, most publications are on the subject of medical and health sciences, which accounted for 34% of all the publications registered with Scopus in the three-year period 2008–2010 (Figure 3.4).

Other major disciplines mentioned in this data and in the classification of scientific disciplines used are natural sciences and biological and environmental sciences. The greatest change in the 2000s is the fall in the contribution from medical and health sciences by four percentage points and the corresponding rise of seven percentage points in social sciences.

The citation indices for medical and health sciences, natural sciences and biological and environmental sciences rose in line with the citation index for the whole country (Figure 3.5). However, the rise in the indices for agricultural and forestry sciences, engineering and technology and social sciences ceased in the middle of the decade, and was followed by a decline. At the end of the decade, medical and health sciences and agricultural and forestry sciences were in the best position, and above the national average. The citation index for all the main scientific indices was, in any case, over the world average.

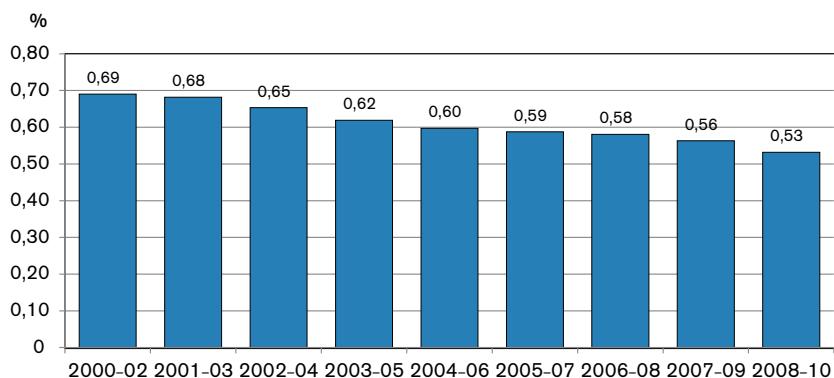

Figure 3.2. Finnish share of world publications 2000–2010 according to Scopus, % (fractionalised publications)

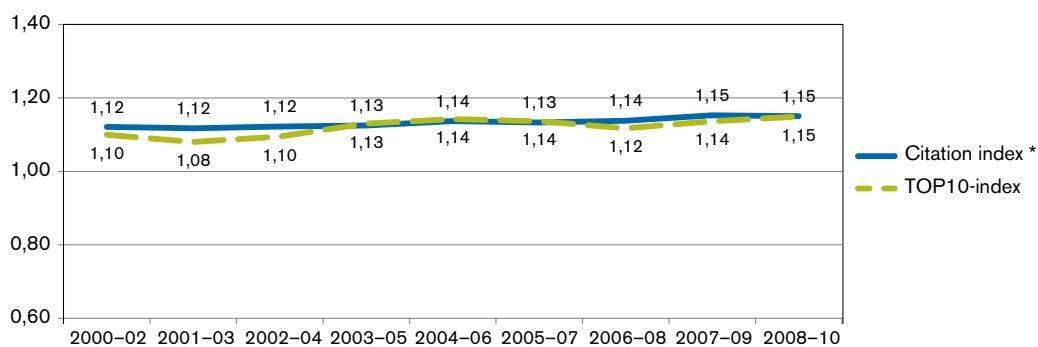

Figure 3.3. Citation index and Top10 index 2000–2010 according to Scopus.

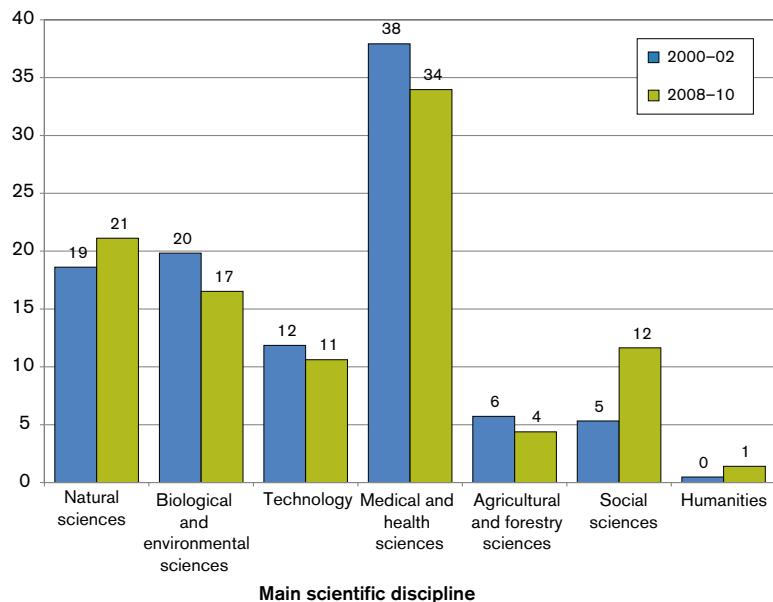

Figure 3.4. Contributions made by the main scientific disciplines to Finnish publications (fractionalised) in the periods 2000–2002 and 2008–2010, according to Scopus, %

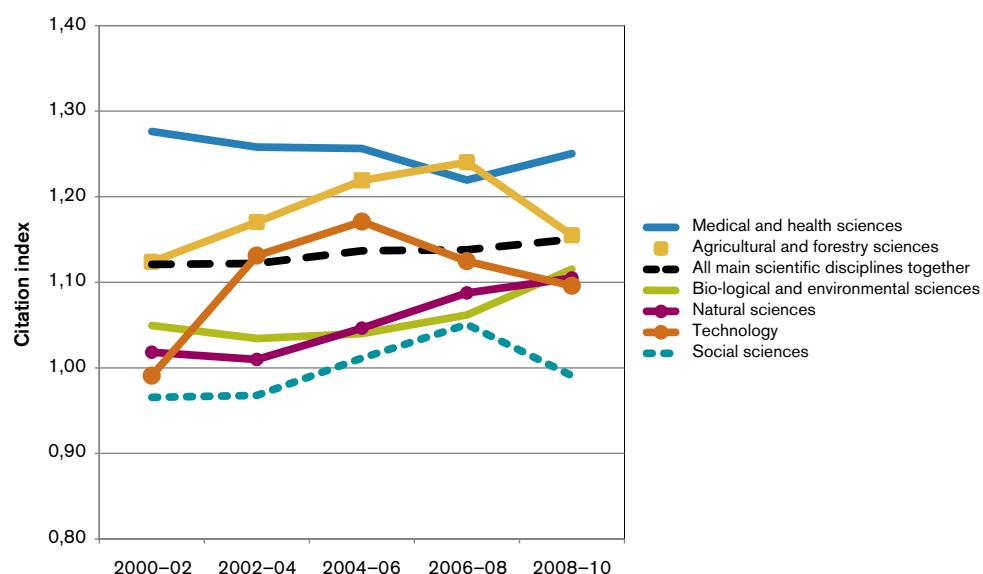

Figure 3.5. Citation index for the main scientific disciplines that are biggest in terms of publication numbers 2000–2010 according to Scopus, %

Research organisations

Among research organisations, it is the universities that produce most publications – 12,500 in the three-year period 2008–2010 (Figure 3.6). They account for 58% of the total for Finland (Figure 3.7). The number of publications from state research institutes was 2,500 (11.6 %), and from university hospitals

2,300 (10.5%). Only the publication numbers for universities rose appreciably in the 2000s. Publication numbers for hospital districts remained below the 1,000 mark, while those for companies exceeded it. Universities of applied sciences accounted for just 0.9% of all publications by the end of the decade.

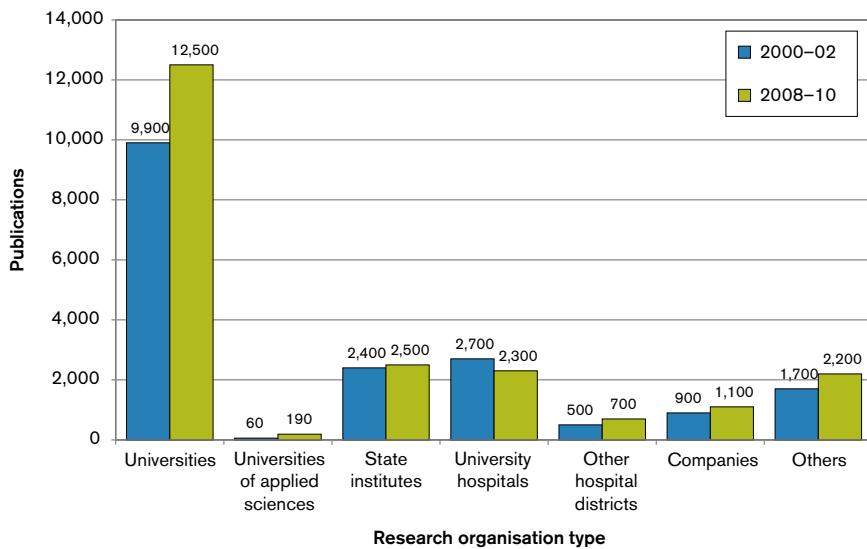

Figure 3.6. Number of publications (fractionalised) by research organisation type 2000–2010, according to Scopus

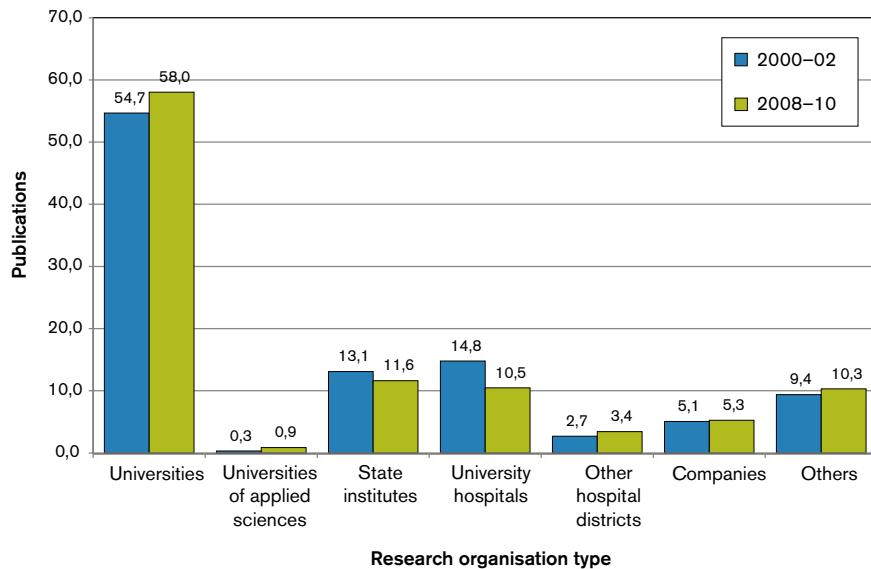

Figure 3.7. Contributions by research organisation type to Finnish publications 2008–2010, according to Scopus, %

The citation indices for university hospitals and hospital districts were above the national average throughout the 2000s, and the same is true of universities. The citation index for state research institutes dipped in the latter half of the decade and fell below the national average (Figure 3.8). The citation index for companies remained below the international average throughout the decade, but exceeded it in the last three-year period. The small number of publications from universities of applied sciences attracted a high

number of citations in the latter half of the 2000s.

Of the research organisations that are biggest in terms of publication numbers, the National Institute for Health and Welfare has the highest citation index (1.36), with Kuopio University Central Hospital in second place (1.33). Third is the University of Helsinki (1.30), and fourth is Helsinki University Central Hospital (1.27). The citation index for all the research organisations apart from the Finnish Forest Research Institute (Metla) exceeds the world average (Figure 3.8).

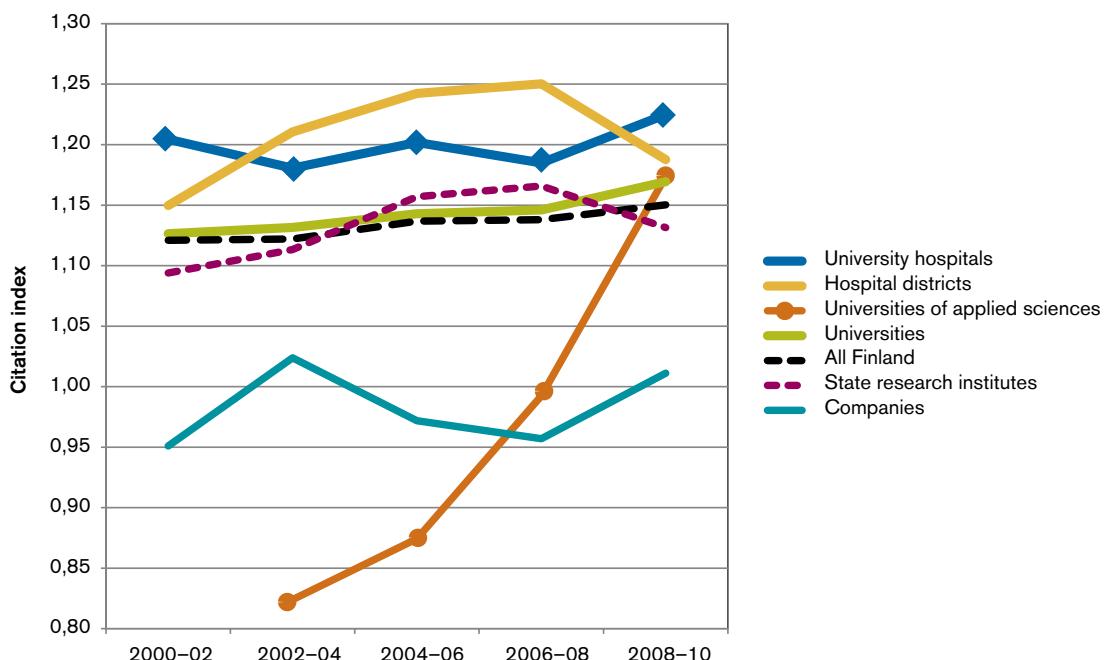

Figure 3.8. Trend in the citation index by research organisation type 2000–2010, according to Scopus

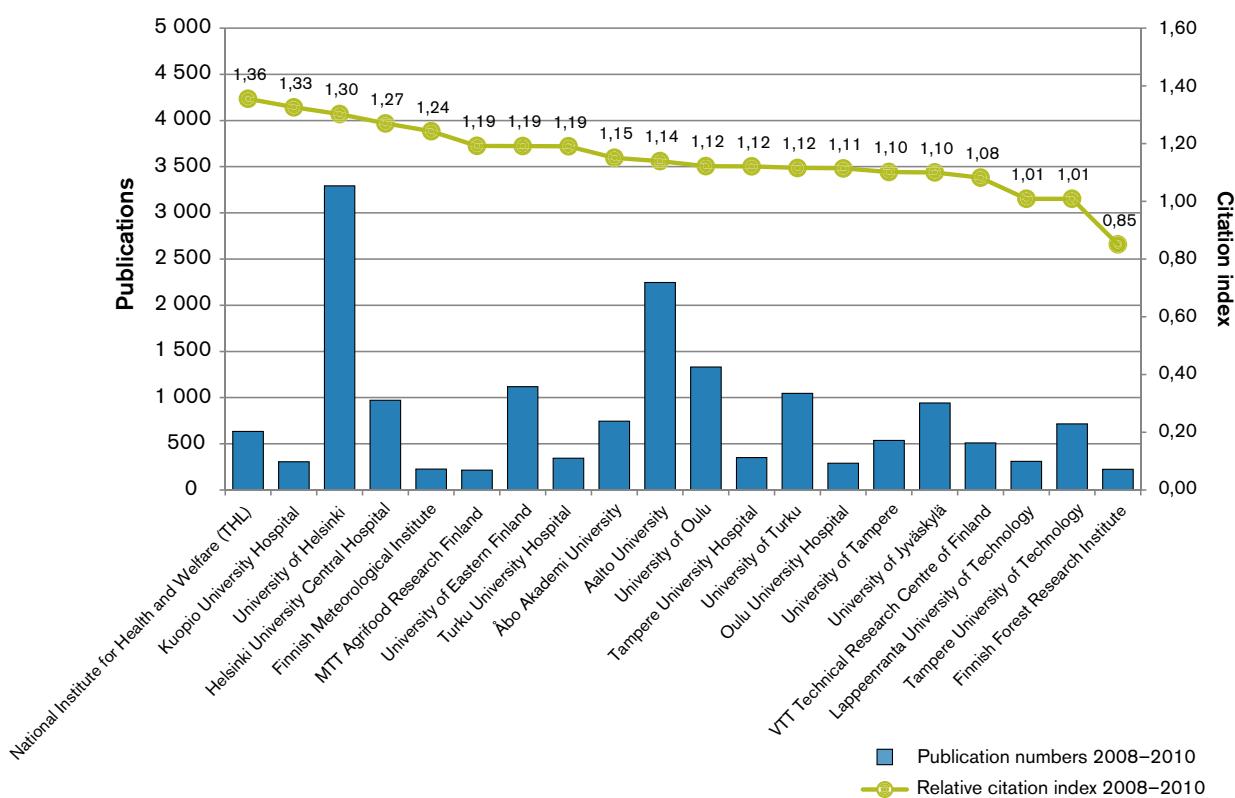

Figure 3.9. Citation indices for the biggest research organisations 2008–2010, according to Scopus NB. The diagram gives the data for the 20 research organisations that are biggest in terms of their publication numbers.

Finland's position in an international comparison

In a comparison of OECD countries, 20 were in average position or above it on the citation index and Top10 index globally in the period 2008–2010 (Figures 3.10 and 3.11). The top three countries were the Netherlands, Switzerland and Denmark. The citation indices for all countries compared, apart from the United States and Iceland, were higher in the period 2008–2010 than at the start of the decade.

An examination of Finland's position using the citation indicators shows that global competition in publishing intensified in the 2000s. Finland's position declined in the comparison of OECD countries, although both the Finnish citation index and its Top10 index were in a slightly stronger position in 2008–2010 than at the beginning of the decade (Figure 3.12). Finland ranked ninth in both comparisons at the start of the 2000s. Its position in the most recent period was 13 (citation index) and 12 (Top10 index). Climbing up ahead of Finland in the 2000s were Belgium, Germany, Austria and Australia, when positions in both comparisons are examined.

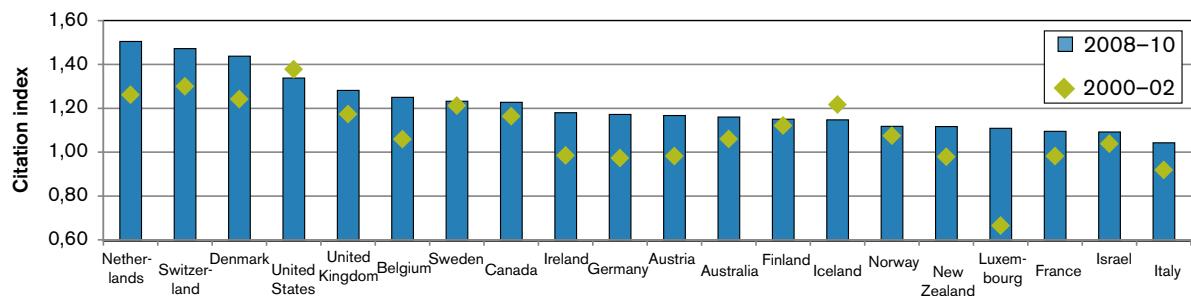

Figure 3.10. Citation index for OECD countries in average position or above it on the global scale in the most recent period 2000–2002 and 2008–2010

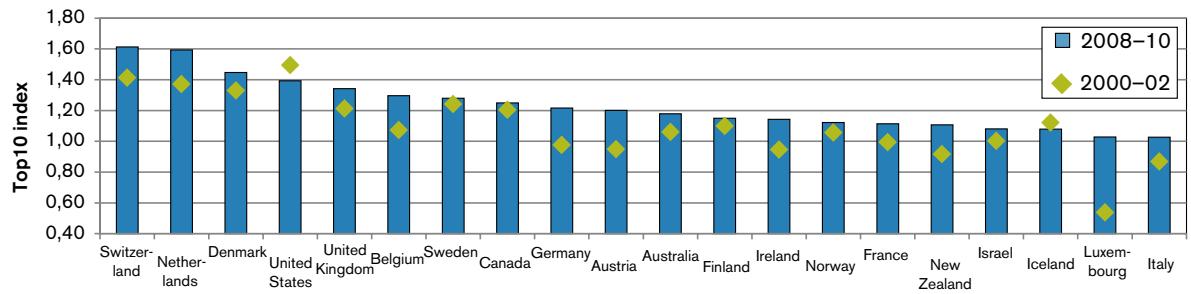

Figure 3.11. Top10 index for OECD countries in average position or above it on the global scale in the most recent period 2000–2002 and 2008–2010

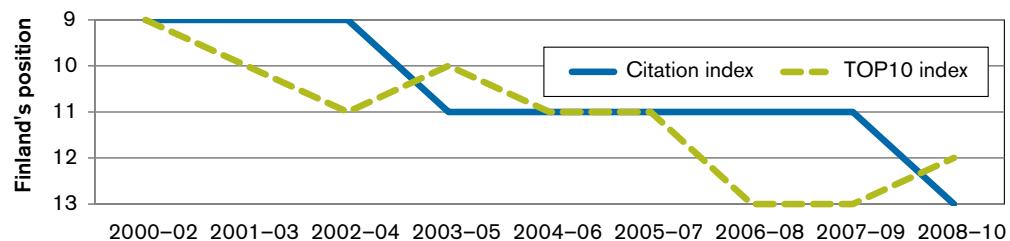

Figure 3.12. Finland's position in a comparison of the relative citation indices and Top10 indices for OECD countries 2000–2010

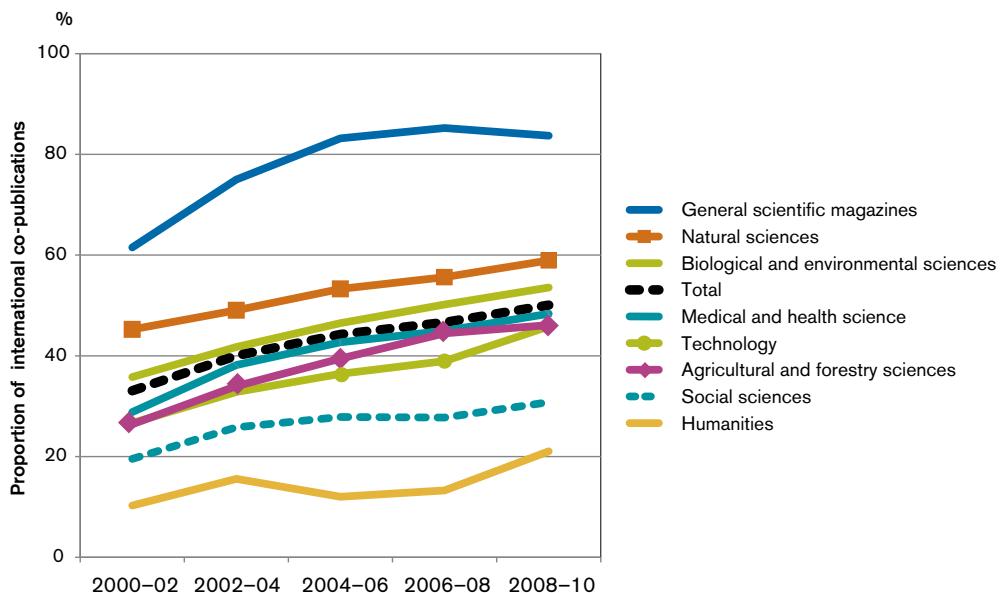

Figure 3.13. Proportion of international co-publications by scientific discipline 2000–2010.

Internationalisation of Finnish science

Most research is conducted outside Finland, so international cooperation is very important for Finnish science. Almost half of the Finnish publications in the period 2008–2010 were produced in collaboration with foreign research organisations. The share of international co-publications grew in the 2000s in all scientific disciplines. Collaborations are highly significant in natural and medical sciences, a major part of research into which is published in general scientific magazines. The share of international co-publications in the humanities and the social sciences is far smaller than with other disciplines (Figure 3.13).

Research organisations by main scientific discipline

The diagrams for individual main scientific disciplines (3.14–32.19) give the number of publications and the citation index for all those research organisations that released more than 100 publications in the scientific field under scrutiny in the period 2008–2010. The position of a research organisation in the period 2008–2010 is indicated by a coloured ball that moves along the vertical axis

to reflect the citation index and along the horizontal axis to represent the number of publications. The size of the ball, furthermore, is determined by the number of publications. The lighter-coloured ball represents the number of publications and the citation index for a research organisation in the period 2000–2002. A comparison of the situation in 2008–2010 with that in 2000–2002 reveals how the position of the various research organisations changed over the whole decade.

In natural sciences, Aalto University overtook the University of Helsinki in the number of publications, though the latter has the highest value on the citation index. The citation indices for Aalto University and the University of Jyväskylä fell close to the world average, whereas the University of Oulu, the University of Eastern Finland and VTT Technical Research Centre of Finland improved their position on the citation index to one that was considerably over the world average. The citation index value for the Tampere University of Technology also surpassed the world average.

In biological and environmental sciences, the University of Helsinki greatly outstrips the others in numbers of publications, achieving the highest citation index value. The citation index value for seven other research organisations also surpasses the world average.

In engineering and technology, Aalto University increased its lead as the largest publisher compared to

the other research organisations. The citation index for publications of Åbo Akademi University climbed to outstrip Aalto in the 2000s. Meanwhile, the citation index for the University of Oulu fell below the figure for Aalto, while remaining above the world average. The citation index for the Tampere University of Technology rose close to the world average.

The University of Helsinki overtook Helsinki University Central Hospital as the biggest publisher in the field of medical and health sciences. The highest citation index value was obtained by the National Institute for Health and Welfare. Furthermore, the University of Eastern Finland, Åbo Akademi University, Tampere University of Technology and the University of Oulu achieved higher citation index

values than Helsinki University Central Hospital and the University of Helsinki, or values as high as the last two institutions, clearly exceeding the world average.

In the field of agricultural and forestry sciences, only the University of Helsinki produced more than 100 publications in the period 2008–2010.

The University of Helsinki publishes the most with respect to social sciences. However, during the 2000s, seven other universities produced over 100 publications in that field. The University of Turku, Aalto University and the University of Jyväskylä have the highest citation index values, surpassing the world average.

In the humanities, only the University of Helsinki produced more than 100 publications in the period 2008–2010.

4 Web of Science and Scopus: comparison of results

Coverage

Figure 4.1 shows the trend in the difference in publication numbers for WoS and Scopus during the first decade of the present Millennium. The diagram shows that the difference between the

databases is not great, but there is a clear trend during the first few years of the decade: WoS is more comprehensive, but, following the launch of Scopus, the latter succeeded in reaching a larger number of Finnish publications.

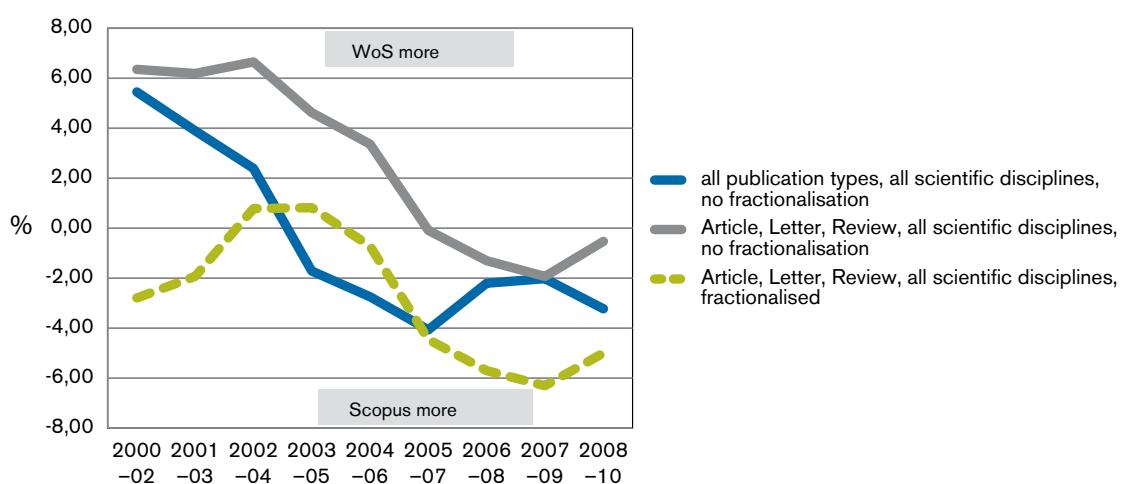

Figure 4.1. Differences between the numbers of Finnish publications in WoS and Scopus by scientific discipline 2000–2010, % of the more comprehensive database.

The diagram was produced in such a way that for each scientific discipline⁴, the number of Scopus publications was deducted from the number of WoS publications, after which the difference was divided by the number of publications in the more comprehensive database. Results with a positive value (+) mean that WoS is more comprehensive for the category of publication under scrutiny, and negative results (-) mean that Scopus is more comprehensive. Coverage is compared with reference to three publication types: 1) all non-fractionalised Finnish publications found in the database, 2) non-fractionalised publications in the Article, Letter and Review category, and 3) the fractionalised publication number for the same types.

An examination by scientific discipline for the period 2007–2009 shows that Scopus has more Finnish publications in all scientific fields except for medical and health sciences and the humanities, in which WoS is more comprehensive. In addition, WoS is slightly more comprehensive in the area of fractionalised publications on natural sciences.

The discipline-specific weighting differences are reflected on the organisational level. Universities

that are oriented towards technology and business will find more of their publications in Scopus, but universities with a medical faculty are more widely represented in the WoS database. The University of Oulu, which has both a medical and a technical and scientific faculty, is better represented in Scopus (Figure 4.3). The difference between major universities is 10–30% of the number of publications in the more comprehensive database, but with the small universities, the difference may be as much as 40% or more.

Furthermore, the state research institutes divide into two groups, according to which database has more publications by them. The difference shows that the Finnish Food Safety Authority Evira, the Finnish Meteorological Institute, MTT Agrifood Research Finland and VTT Technical Research Centre of Finland benefit most from Scopus; WoS, on the other hand, is a more suitable database for the Geological Survey of Finland, Forest Research Institute (Metla), National Institute for Health and Welfare and Institute of Occupational Health (Figure 4.4).

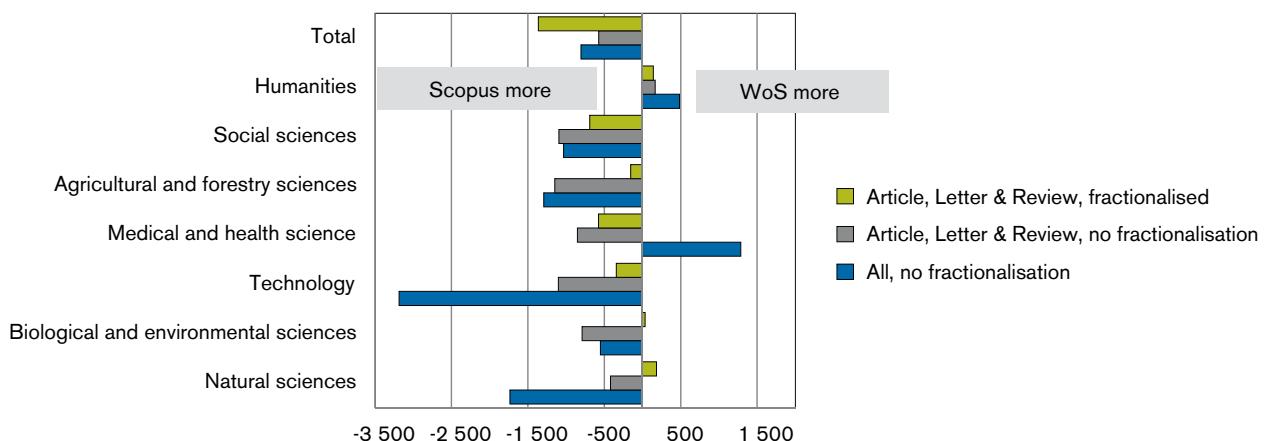

Figure 4.2. Difference between numbers of Finnish publications in WoS and Scopus by scientific discipline 2000–2010.

⁴ There is statistical bias in the non-fractionalised results, due to the different classifications of scientific disciplines in the databases. The discipline system used in Scopus contains more categories than that in WoS, and it is partly owing to this that, on average, more disciplines are recorded for the publications contained in Scopus than is the case with WoS. Thus, a single publication may appear in Scopus more frequently under many disciplines and therefore may be counted many times. This bias is absent in the total number of Finnish publications, because each publication is only included once in the end result.

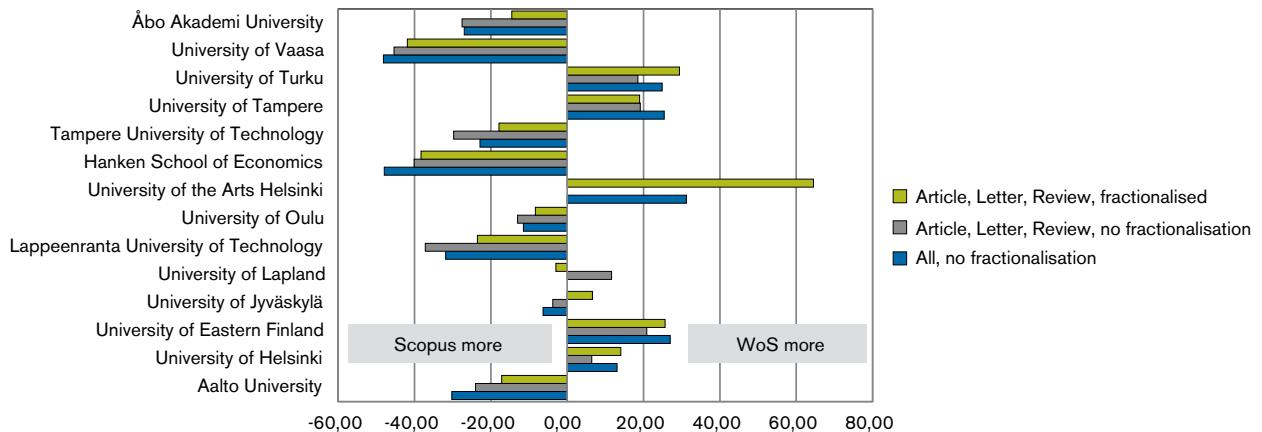

Figure 4.3. Difference between numbers of Finnish publications in WoS and Scopus by university 2007–2009, %

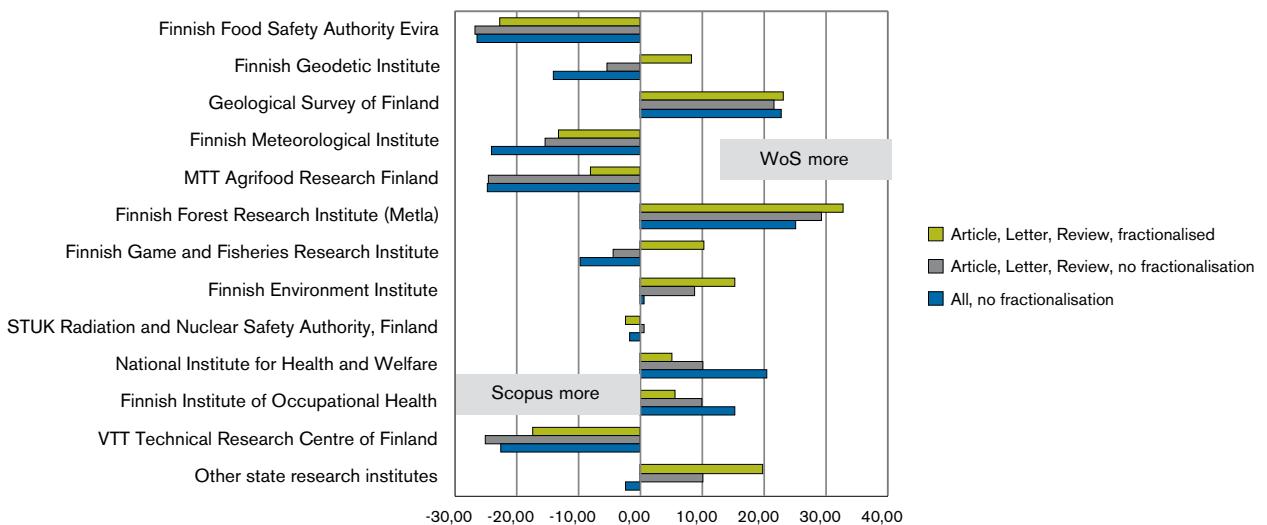

Figure 4.4. Difference between numbers of Finnish publications in WoS and Scopus by research institute 2007–2009, %

Citation and Top10 index

The Scopus citation index gives patently higher values for Finnish publications than WoS (Figure 4.5)⁵. The difference is mainly due to the fact that there is clearly a larger number of Finnish publications in English than what is average for the publications in Scopus. Publications in English attract more references than others. The WoS database, meanwhile, consists almost entirely of publications written in English, which is why the Finnish publications do not gain an advantage, compared to the other WoS publications.

A more accurate picture of the differences between the databases is provided by Finland's position in the citation index when compared with the major science nations (Figure 4.6). In each three-year period between 2000 and 2010, the Finnish citation index has been given a higher position by Scopus than by WoS. Furthermore, Finland's position was generally better in the Scopus data. In the period 2008–2010, Finland was in the same position (13) in both sets of data.

⁵ The difference between the databases is more or less the same in the Top10 index, though even more in Scopus's favour.

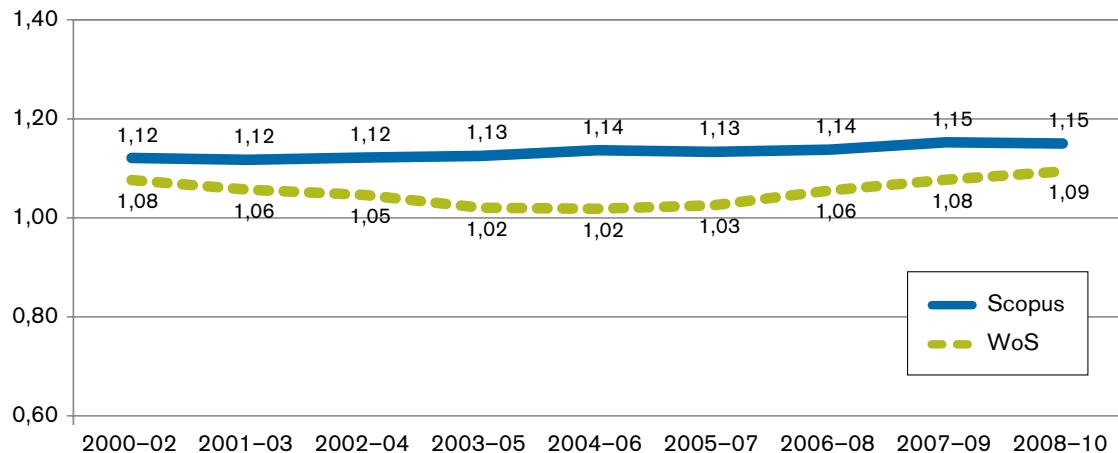

Figure 4.5. Citation index according to the WoS and Scopus data 2000–2010

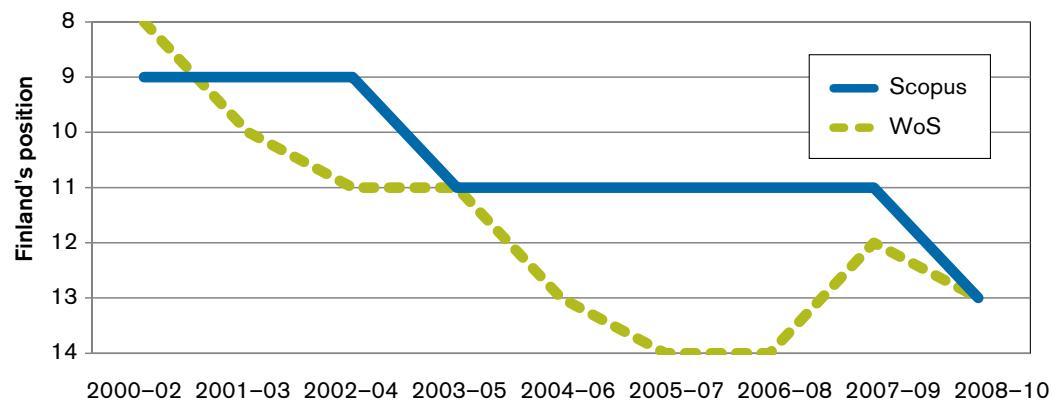

Figure 4.6. Finland's position in a comparison of the citation indices for OECD countries 2000–2010, according to the WoS and Scopus databases

Figure 4.7 compares the databases for the citation index for universities. The horizontal axis represents the WoS citation index for universities, and the vertical axis the Scopus one. The sizes of the circles representing the universities correspond to their publication numbers. The diagram includes universities for which the publication number exceeds 100 in the three-year period 2007–2009. The universities beneath the broken line receive a higher citation index value in the WoS database, and those above it receive a higher citation index value in the Scopus database. All the universities

under scrutiny receive a higher citation index value in Scopus than in WoS, with the exception of the University of Jyväskylä.

Figure 4.8 gives the corresponding results for the biggest state research institutes. With these the situation is the reverse: the majority of institutes achieve a higher citation index value in the WoS database.

The respective positions of universities depends on which database is used in a national comparison. Table 4.1 shows how the positions based on the relative citation index for the biggest universities

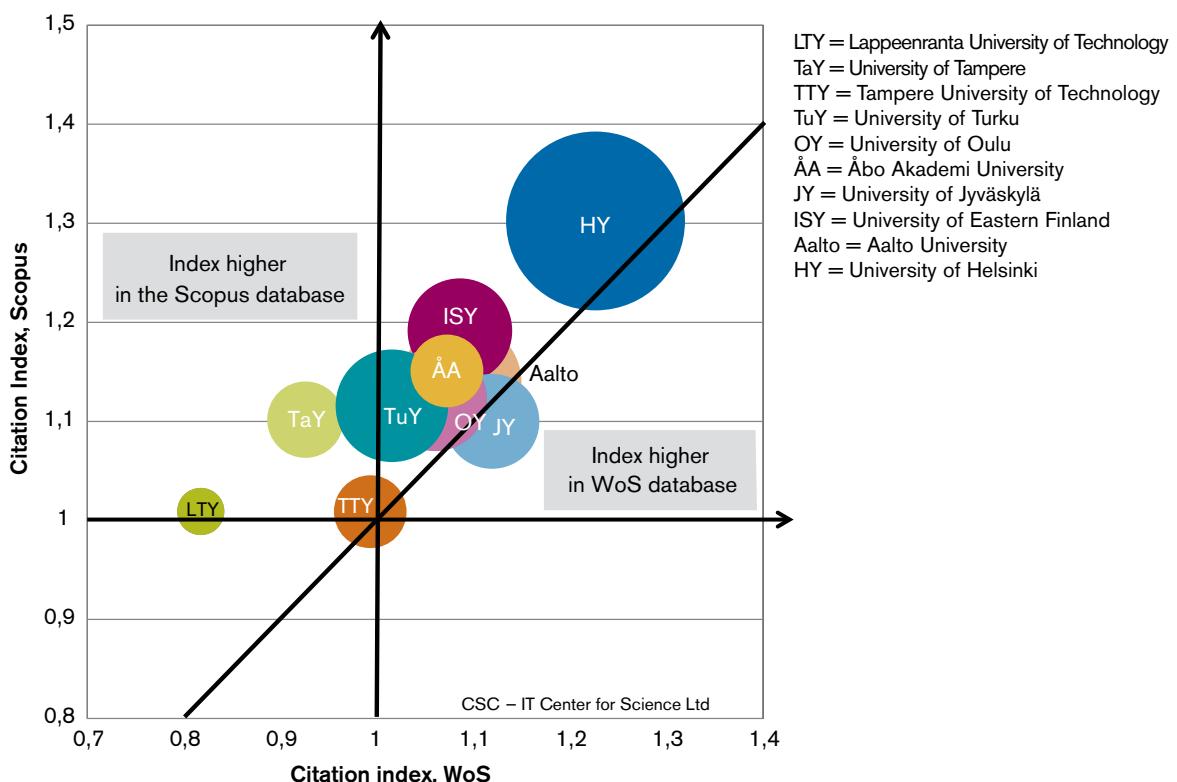

Figure 4.7. Relative citation index for universities 2007-2009, according to the WoS and Scopus databases.

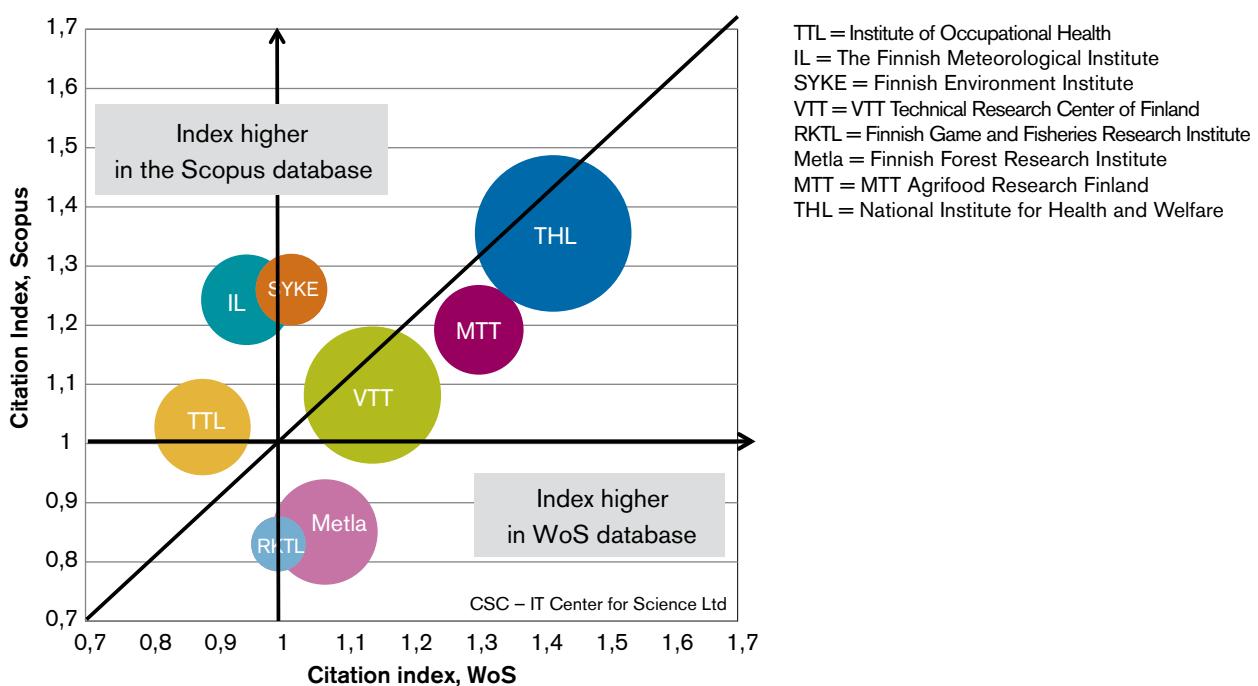

Figure 4.8. Relative citation index for research institutes 2007–2009, according to the WoS and Scopus databases.

change over the period 2004–2010, if Scopus is used instead of WoS. The change in position is depicted by means of positive (+) and negative (-) figures. A positive figure means that the position improves if one moves from the WoS citation index to the Scopus index, and a negative figure means that the position weakens. The final column gives the average

value for all five periods examined. The University of Eastern Finland (average rise of 2.2 places per period), University of Oulu (rise of 1.2 places per period) and University of Tampere (one place per period) all benefit from the Scopus database. But Scopus is manifestly a poor option for the University of Jyväskylä (fall of 4 places per period).

Table 4.1. Change in the position of the biggest universities in a national comparison with Scopus being used instead of WoS

Position (WoS) - position (Scopus)	2004–06	2005–07	2006–08	2007–09	2008–10	Average

Appendix 1.

Classification of disciplines

WoS category	Main scientific discipline
Mathematics	
Mathematics	Natural sciences
Mathematics, Applied	Natural sciences
Mathematics, General	Natural sciences
Mathematics, Interdisciplinary Applications	Natural sciences
Logic	Natural sciences
Statistics & Probability	Natural sciences
Computer Science	
Computer Science, Artificial Intelligence	Natural sciences
Computer Science, Cybernetics	Natural sciences
Computer Science, Information Systems	Natural sciences
Computer Science, Interdisciplinary	
Applications	Natural sciences
Computer Science, Software Engineering	Natural sciences
Computer Science, Theory & Methods	Natural sciences
Computer Applications & Cybernetics	Natural sciences
Physics	
Acoustics	Natural sciences
Imaging Science & Photographic Technology	Natural sciences
Instruments & Instrumentation	Natural sciences
Mechanics	Natural sciences
Nanoscience & Nanotechnology	Technology
Nuclear Science & Technology	Natural sciences
Optics	Natural sciences
Physics, Applied	Natural sciences
Physics, Atomic, Molecular & Chemical	Natural sciences
Physics, Condensed Matter	Natural sciences
Physics, Fluids & Plasmas	Natural sciences
Physics, Mathematical	Natural sciences
Physics, Multidisciplinary	Natural sciences
Physics, Nuclear	Natural sciences
Physics, Particles & Fields	Natural sciences
Spectroscopy	Natural sciences
Astronomy & Astrophysics	Natural sciences
Remote Sensing	Natural sciences
Chemistry	
Chemistry, Analytical	Natural sciences
Chemistry, Applied	Natural sciences
Chemistry, Inorganic & Nuclear	Natural sciences
Chemistry, Multidisciplinary	Natural sciences
Chemistry, Organic	Natural sciences
Chemistry, Physical	Natural sciences
Crystallography	Natural sciences
Electrochemistry	Natural sciences
Polymer Science	Natural sciences
Earth Sciences	
Geochemistry & Geophysics	Natural sciences
Geography	Biological and environmental sciences
	Biol. and environm.sc.
Geography, Physical	Natural sciences
Geology	Natural sciences
Geosciences, Multidisciplinary	Natural sciences
Meteorology & Atmospheric Sciences	Natural sciences
Mineralogy	Natural sciences
Oceanography	Natural sciences
Paleontology	Natural sciences
Soil Science	Natural sciences
Water Resources	Natural sciences
Environmental Sciences	Biol. and environm.sc.
Biology	
Biology	Biol. and environm.sc.
Biology, Miscellaneous	Biol. and environm.sc.
Biodiversity Conservation	Biol. and environm.sc.
Ecology	Biol. and environm.sc.
Entomology	Biol. and environm.sc.
Evolutionary Biology	Biol. and environm.sc.
Limnology	Biol. and environm.sc.
Marine & Freshwater Biology	Biol. and environm.sc.
Mycology	Biol. and environm.sc.
Ornithology	Biol. and environm.sc.
Zoology	Biol. and environm.sc.
Microbiology	
Biochemistry & Molecular Biology	Biol. and environm.sc.
Biochemical Research Methods	Biol. and environm.sc.
Biophysics	Biol. and environm.sc.
Cell Biology	Biol. and environm.sc.
Mathematical & Computational Biology	Biol. and environm.sc.
Microscopy	Biol. and environm.sc.
Biotechnology & Applied Microbiology	Biol. and environm.sc.
Microbiology	Biol. and environm.sc.
Plant Sciences	Biol. and environm.sc.
Virology	Biol. and environm.sc.
Developmental Biology	Biol. and environm.sc.
Genetics & Heredity	Biol. and environm.sc.
Reproductive Biology	Biol. and environm.sc.

WoS category	Main scientific discipline		
Engineering			
Architecture	Technology	Pharmacology & Pharmacy	Medical and health sc.
Construction & Building Technology	Technology	Toxicology	Medical and health sc.
Engineering, Civil	Technology	Cell and Tissue Engineering	Biol. and environm. sc.
Transportation	Technology	Materials Science, Biomaterials	Technology
Transportation Science & Technology	Technology	Allergy	Medical and health sc.
Agricultural Engineering	Technology	Andrology	Medical and health sc.
Engineering, Aerospace	Technology	Cardiac & Cardiovascular System	Medical and health sc.
Engineering, Industrial	Technology	Dermatology	Medical and health sc.
Engineering, Manufacturing	Technology	Endocrinology & Metabolism	Medical and health sc.
Engineering, Mechanical	Technology	Gastroenterology & Hepatology	Medical and health sc.
Metallurgy & Mining	Technology	Geriatrics and Gerontology	Medical and health sc.
Metallurgy & Metallurgical Engineering	Technology	Gerontology	Medical and health sc.
Thermodynamics	Technology	Hematology	Medical and health sc.
Electrical Engineering		Integrative & Complementary Medicine	Medical and health sc.
Automation & Control Systems	Technology	Medicine, General & Internal	Medical and health sc.
Engineering, Electrical & Electronic	Technology	Peripheral Vascular Disease	Medical and health sc.
Robotics	Technology	Rehabilitation	Medical and health sc.
Computer Science, Hardware & Architecture	Technology	Respiratory System	Medical and health sc.
Telecommunications	Technology	Rheumatology	Medical and health sc.
Materials Sciences		Urology & Nephrology	Medical and health sc.
Engineering, Chemical	Technology	Oncology	Medical and health sc.
Materials Science, Ceramics	Technology	Obstetrics & Gynecology	Medical and health sc.
Materials Science, Characterization, Testing	Technology	Pediatrics	Medical and health sc.
Materials Science, Coatings & Films	Technology	Clinical Neurology	Medical and health sc.
Materials Science, Composites	Technology	Audiology, Speech-Language Pathology	Medical and health sc.
Materials Science, Multidisciplinary	Technology	Psychiatry	Medical and health sc.
Materials Science, Paper & Wood	Technology	Psychology, Clinical	Social sciences
Materials Science, Textiles	Technology	Ophthalmology	Medical and health sc.
Energy & Fuels	Technology	Otorhinolaryngology	Medical and health sc.
Engineering, Environmental	Technology	Anesthesiology	Medical and health sc.
Engineering, Geological	Technology	Critical Care Medicine	Medical and health sc.
Engineering, Marine	Technology	Emergency Medicine	Medical and health sc.
Engineering, Ocean	Technology	Orthopedics	Medical and health sc.
Engineering, Petroleum	Technology	Radiology, Nuclear Medicine & Medical Imaging	Medical and health sc.
Mining & Mineral Processing	Technology	Surgery	Medical and health sc.
Computer Critical Reviews	Technology	Transplantation	Medical and health sc.
Engineering, Multidisciplinary	Technology	Dentistry, Oral Surgery & Medicine	Medical and health sc.
Biomedicine		Ergonomics	Medical and health sc.
Engineering, Biomedical	Medical and health sc.	Infectious Diseases	Medical and health sc.
Medical Laboratory Technology	Medical and health sc.	Medical Ethics	Medical and health sc.
Anatomy & Morphology	Medical and health sc.	Nutrition & Dietetics	Medical and health sc.
Cytology & Histology	Medical and health sc.	Parasitology	Medical and health sc.
Immunology	Medical and health sc.	Substance Abuse	Medical and health sc.
Medical Informatics	Medical and health sc.	Tropical Medicine	Medical and health sc.
Medicine, Research & Experimental	Medical and health sc.	Public, Environmental & Occupational Health	Medical and health sc.
Pathology	Medical and health sc.	Sport Sciences	Medical and health sc.
Physiology	Medical and health sc.	Health Care Sciences & Services	Medical and health sc.
Neuroimaging	Medical and health sc.	Health Policy & Services	Medical and health sc.
Neurosciences	Biol. and environm. sc.	Primary Health Care	Medical and health sc.
Chemistry, Medicinal	Medical and health sc.	Nursing	Medical and health sc.
		Medicine, Legal	Medical and health sc.
		Medicine, Miscellaneous	Medical and health sc.

WoS category	Main scientific discipline
Agricultural Sciences	
Agricultural Economics & Policy	Social sciences
Agriculture, Soil Science	Agricul.and forestry sc.
Agronomy	Agricul.and forestry sc.
Fisheries	Agricul.and forestry sc.
Horticulture	Agricul.and forestry sc.
Forestry	Agricul.and forestry sc.
Agriculture, Dairy & Animal Science	Agricul.and forestry sc.
Veterinary Sciences	Medical and health sc.
Agriculture, Multidisciplinary	Agricul.and forestry sc.
Food Science & Technology	Agricul.and forestry sc.
Business and Management	
Economics	Social sciences
Social Sciences, Mathematical Methods	Social sciences
Business	Social sciences
Business, Finance	Social sciences
Management	Social sciences
Operations Research & Management Science	Social sciences
Demography	Social sciences
Family Studies	Social sciences
History of Social Sciences	Social sciences
Social Sciences, Interdisciplinary	Social sciences
Sociology	Social sciences
History & Philosophy of Science (Social Sciences)	Social sciences
Industrial Relations & Labor	Social sciences
Social Issues	Social sciences
Social Sciences, Biomedical	Medical and health sc.
Social Work	Social sciences
Communication	Social sciences
Information Science and Library Science	Social sciences
Environmental Studies	Biol. and environm. sc.
Hospitality, Leisure, Sport & Tourism	Humanities, Arts
Urban Studies	Biol. and environm. sc.
Psychology	Social sciences
Psychology, Multidisciplinary	Social sciences
Psychology, Applied	Social sciences
Psychology, Biological	Social sciences
Psychology, Developmental	Social sciences
Psychology, Educational	Social sciences
Psychology, Experimental	Social sciences
Psychology, Mathematical	Social sciences
Psychology, Psychoanalysis	Social sciences
Psychology, Social	Social sciences
Psychiatry (Social Sciences)	Social sciences
Behavioral Sciences	Biol. and environm. sc.
Education & Educational Research	Social sciences
Education, Scientific Disciplines	Social sciences
Education, Special	Social sciences
Criminology & Penology	Social sciences
Law	Social sciences
International Relations	Social sciences
Planning & Development	Social sciences
Political Science	Social sciences
Public Administration	Social sciences
Ethics	Humanities, Arts
History & Philosophy of Science	Humanities, Arts
Philosophy	Humanities, Arts
Religion	Humanities, Arts
Applied Linguistics	Humanities, Arts
Language & Linguistics Theory	Humanities, Arts
Linguistics	Humanities, Arts
Classics	Humanities, Arts
Literary Reviews	Humanities, Arts
Literary Theory & Criticism	Humanities, Arts
Literature	Humanities, Arts
Literature, African, Australian, Canadian	Humanities, Arts
Literature, American	Humanities, Arts
Literature, British Isles	Humanities, Arts
Literature, German, Dutch, Scandinavian	Humanities, Arts
Literature, Romance	Humanities, Arts
Literature, Slavic	Humanities, Arts
Poetry	Humanities, Arts
Dance	Humanities, Arts
Music	Humanities, Arts
Theater	Humanities, Arts
Art	Humanities, Arts
Film, Radio, Television	Humanities, Arts
Archaeology	Humanities, Arts
History	Humanities, Arts
Medieval & Renaissance Studies	Humanities, Arts
Anthropology	Humanities, Arts
Cultural Studies	Humanities, Arts
Oriental Studies	Humanities, Arts
Area Studies	Humanities, Arts
Asian Studies	Humanities, Arts
Ethnic Studies	Humanities, Arts
Folklore	Humanities, Arts
Humanities, Multidisciplinary	Humanities, Arts

ASJC Scientific discipline	Main scientific discipline in standard report	
Agricultural and Biological Sciences (all)	Agricul. and forestry sc.	
Agricultural and Biol. Sciences (miscellaneous)	Agricul. and forestry sc.	
Agronomy and Crop Science	Agricul. and forestry sc.	
Animal Science and Zoology	Biol. and environm. sc.	
Aquatic Science	Agricul. and forestry sc.	
Ecology, Evolution, Behavior and Systematics	Biol. and environm. sc.	
Food Science	Agricul. and forestry sc.	
Forestry	Agricul. and forestry sc.	
Horticulture	Agricul. and forestry sc.	
Insect Science	Biol. and environm. sc.	
Plant Science	Biol. and environm. sc.	
Soil Science	Natural sciences	
Arts and Humanities (all)	Humanities, Arts	
Arts and Humanities (miscellaneous)	Humanities, Arts	
History	Humanities, Arts	
Language and Linguistics	Humanities, Arts	
Archaeology	Humanities, Arts	
Classics	Humanities, Arts	
Conservation	Humanities, Arts	
History and Philosophy of Science	Humanities, Arts	
Literature and Literary Theory	Humanities, Arts	
Museology	Humanities, Arts	
Music	Humanities, Arts	
Philosophy	Humanities, Arts	
Religious studies	Humanities, Arts	
Visual Arts and Performing Arts	Humanities, Arts	
Biochemistry, Genetics and Molecular Biology (all)	Biol. and environm. sc.	
Biochemistry, Genetics and Molecular Biology (miscellaneous)	Biol. and environm. sc.	
Ageing	Biol. and environm. sc.	
Biochemistry	Biol. and environm. sc.	
Biophysics	Biol. and environm. sc.	
Biotechnology	Biol. and environm. sc.	
Cancer Research	Medical and health sc.	
Cell Biology	Biol. and environm. sc.	
Clinical Biochemistry	Medical and health sc.	
Developmental Biology	Biol. and environm. sc.	
Endocrinology	Medical and health sc.	
Genetics	Biol. and environm. sc.	
Molecular Biology	Biol. and environm. sc.	
Molecular Medicine	Medical and health sc.	
Physiology	Medical and health sc.	
Structural Biology	Biol. and environm. sc.	
Business, Management and Accounting (all)	Social sciences	
Business, Management and Accounting (misc.)	Social sciences	
Accounting	Social sciences	
Business and International Management	Social sciences	
Management Information Systems	Social sciences	
Management of Technology and Innovation		
Marketing	Social sciences	
Organizational Behavior and Human Resource Management	Social sciences	
Strategy and Management	Social sciences	
Tourism, Leisure and Hospitality Management	Social sciences	
Industrial relations	Social sciences	
Chemical Engineering (all)	Technology	
Chemical Engineering (miscellaneous)	Technology	
Bioengineering	Biol. and environm. sc.	
Catalysis	Technology	
Chemical Health and Safety	Technology	
Colloid and Surface Chemistry	Technology	
Filtration and Separation	Technology	
Fluid Flow and Transfer Processes	Technology	
Process Chemistry and Technology	Technology	
Chemistry (all)	Natural sciences	
Chemistry (miscellaneous)	Natural sciences	
Analytical Chemistry	Natural sciences	
Electrochemistry	Natural sciences	
Inorganic Chemistry	Natural sciences	
Organic Chemistry	Natural sciences	
Physical and Theoretical Chemistry	Natural sciences	
Spectroscopy	Natural sciences	
Computer Science (all)	Natural sciences	
Computer Science (miscellaneous)	Natural sciences	
Artificial Intelligence	Natural sciences	
Computational Theory and Mathematics	Natural sciences	
Computer Graphics and		
Computer-Aided Design	Natural sciences	
Computer Networks and Communications	Technology	
Computer Science Applications	Natural sciences	
Computer Vision and Pattern Recognition	Natural sciences	
Hardware and Architecture	Technology	
Human-Computer Interaction	Natural sciences	
Information Systems	Natural sciences	
Signal Processing	Technology	
Software	Natural sciences	

ASJC Scientific discipline	Main scientific discipline in standard report	
Decision Sciences (all)	Social sciences	
Decision Sciences (miscellaneous)	Social sciences	
Information Systems and Management	Social sciences	
Management Science and Operations Research	Social sciences	
Statistics, Probability and Uncertainty	Natural sciences	
Earth and Planetary Sciences (all)	Natural sciences	
Earth and Planetary Sciences (misc.)	Natural sciences	
Atmospheric Science	Natural sciences	
Computers in Earth Sciences	Natural sciences	
Earth-Surface Processes	Natural sciences	
Economic Geology	Natural sciences	
Geochemistry and Petrology	Natural sciences	
Geology	Natural sciences	
Geophysics	Natural sciences	
Geotechnical Engineering and Engineering Geology	Technology	
Oceanography	Natural sciences	
Palaeontology	Natural sciences	
Space and Planetary Science	Natural sciences	
Stratigraphy	Natural sciences	
Economics, Econometrics and Finance (all)	Yhteiskuntatieteet	
Economics, Econometrics and Finance (miscellaneous)	Social sciences	
Economics and Econometrics	Social sciences	
Finance	Social sciences	
Energy (all)	Technology	
Energy (miscellaneous)	Technology	
Energy Engineering and Power Technology	Technology	
Fuel Technology	Technology	
Nuclear Energy and Engineering	Technology	
Renewable Energy, Sustainability and the Environment	Technology	
Engineering (all)	Technology	
Engineering (miscellaneous)	Technology	
Aerospace Engineering	Technology	
Automotive Engineering	Technology	
Biomedical Engineering	Medical and health sc.	
Civil and Structural Engineering	Technology	
Computational Mechanics	Technology	
Control and Systems Engineering	Technology	
Electrical and Electronic Engineering	Technology	
Industrial and Manufacturing Engineering	Technology	
Mechanical Engineering	Technology	
Mechanics of Materials	Technology	
Ocean Engineering	Technology	
Safety, Risk, Reliability and Quality	Technology	
Media Technology	Technology	
Building and Construction	Technology	
Architecture	Technology	
Environmental Science (all)	Biol. and environm. sc.	
Environmental Science (miscellaneous)	Biol. and environm. sc.	
Ecological Modelling	Biol. and environm. sc.	
Ecology	Biol. and environm. sc.	
Environmental Chemistry	Biol. and environm. sc.	
Environmental Engineering	Technology	
Global and Planetary Change	Natural sciences	
Health, Toxicology and Mutagenesis	Biol. and environm. sc.	
Management, Monitoring, Policy and Law	Social sciences	
Nature and Landscape Conservation	Biol. and environm. sc.	
Pollution	Biol. and environm. sc.	
Waste Management and Disposal	Biol. and environm. sc.	
Water Science and Technology	Biol. and environm. sc.	
Immunology and Microbiology (all)	Medical and health sc.	
Immunology and Microbiology (misc.)	Medical and health sc.	
Applied Microbiology and Biotechnology	Biol. and environm. sc.	
Immunology	Medical and health sc.	
Microbiology	Biol. and environm. sc.	
Parasitology	Medical and health sc.	
Virology	Biol. and environm. sc.	
Materials Science (all)	Technology	
Materials Science (miscellaneous)	Technology	
Biomaterials	Medical and health sc.	
Ceramics and Composites	Technology	
Electronic, Optical and Magnetic Materials	Technology	
Materials Chemistry	Natural sciences	
Metals and Alloys	Technology	
Polymers and Plastics	Technology	
Surfaces, Coatings and Films	Technology	
Mathematics (all)	Natural sciences	
Mathematics (miscellaneous)	Natural sciences	
Algebra and Number Theory	Natural sciences	
Analysis	Natural sciences	
Applied Mathematics	Natural sciences	
Computational Mathematics	Natural sciences	
Control and Optimization	Natural sciences	
Discrete Mathematics and Combinatorics	Natural sciences	
Geometry and Topology	Natural sciences	
Logic	Natural sciences	
Mathematical Physics	Natural sciences	
Modelling and Simulation	Natural sciences	
Numerical Analysis	Natural sciences	
Statistics and Probability	Natural sciences	
Theoretical Computer Science	Natural sciences	

ASJC Scientific discipline	Main scientific discipline in standard report	
Medicine (all)	Medical and health sc.	
Medicine (miscellaneous)	Medical and health sc.	
Anatomy	Medical and health sc.	
Anesthesiology and Pain Medicine	Medical and health sc.	
Biochemistry, medical	Medical and health sc.	
Cardiology and Cardiovascular Medicine	Medical and health sc.	
Critical Care and Intensive Care Medicine	Medical and health sc.	
Complementary and alternative medicine	Medical and health sc.	
Dermatology	Medical and health sc.	
Drug guides	Medical and health sc.	
Embryology	Medical and health sc.	
Emergency Medicine	Medical and health sc.	
Endocrinology, Diabetes and Metabolism	Medical and health sc.	
Epidemiology	Medical and health sc.	
Family Practice	Medical and health sc.	
Gastroenterology	Medical and health sc.	
Genetics(clinical)	Medical and health sc.	
Geriatrics and Gerontology	Medical and health sc.	
Health Informatics	Medical and health sc.	
Health Policy	Medical and health sc.	
Hematology	Medical and health sc.	
Hepatology	Medical and health sc.	
Histology	Medical and health sc.	
Immunology and Allergy	Medical and health sc.	
Internal Medicine	Medical and health sc.	
Infectious Diseases	Medical and health sc.	
Microbiology (medical)	Medical and health sc.	
Nephrology	Medical and health sc.	
Clinical Neurology	Medical and health sc.	
Obstetrics and Gynaecology	Medical and health sc.	
Oncology	Medical and health sc.	
Ophthalmology	Medical and health sc.	
Orthopedics and Sports Medicine	Medical and health sc.	
Otorhinolaryngology	Medical and health sc.	
Pathology and Forensic Medicine	Medical and health sc.	
Pediatrics, Perinatology, and Child Health	Medical and health sc.	
Pharmacology (medical)	Medical and health sc.	
Physiology (medical)	Medical and health sc.	
Psychiatry and Mental health	Medical and health sc.	
Public Health, Environmental and Occupational Health	Medical and health sc.	
Pulmonary and Respiratory Medicine	Medical and health sc.	
Radiology Nuclear Medicine and imaging	Medical and health sc.	
Rehabilitation	Medical and health sc.	
Reproductive Medicine	Medical and health sc.	
Reviews and References, Medical	Medical and health sc.	
Rheumatology	Medical and health sc.	
Surgery	Medical and health sc.	
Transplantation	Medical and health sc.	
Urology	Medical and health sc.	
Neuroscience (all)		Biol. and environm. sc.
Neuroscience (miscellaneous)		Biol. and environm. sc.
Behavioral Neuroscience		Biol. and environm. sc.
Biological Psychiatry		Medical and health sc.
Cellular and Molecular Neuroscience		Biol. and environm. sc.
Cognitive Neuroscience		Medical and health sc.
Developmental Neuroscience		Biol. and environm. sc.
Endocrine and Autonomic Systems		Biol. and environm. sc.
Neurology		Medical and health sc.
Sensory Systems		Medical and health sc.
Nursing (all)		Medical and health sc.
Nursing (miscellaneous)		Medical and health sc.
Advanced and Specialised Nursing		Medical and health sc.
Assessment and Diagnosis		Medical and health sc.
Care Planning		Medical and health sc.
Community and Home Care		Medical and health sc.
Critical Care		Medical and health sc.
Emergency		Medical and health sc.
Fundamentals and skills		Medical and health sc.
Gerontology		Medical and health sc.
Issues, ethics and legal aspects		Medical and health sc.
Leadership and Management		Medical and health sc.
LPN and LVN		Medical and health sc.
Maternity and Midwifery		Medical and health sc.
Medical–Surgical		Medical and health sc.
Nurse Assisting		Medical and health sc.
Nutrition and Dietetics		Medical and health sc.
Oncology(nursing)		Medical and health sc.
Pathophysiology		Medical and health sc.
Pediatrics		Medical and health sc.
Pharmacology (nursing)		Medical and health sc.
Phychiatric Mental Health		Medical and health sc.
Research and Theory		Medical and health sc.
Review and Exam Preparation		Medical and health sc.
Pharmacology, Toxicology and Pharmaceutics (all)		Medical and health sc
Pharmacology, Toxicology and Pharmaceutics (miscellaneous)		Medical and health sc.
Drug Discovery		Medical and health sc.
Pharmaceutical Science		Medical and health sc.
Pharmacology		Medical and health sc.
Toxicology		Medical and health sc.

ASJC Scientific discipline	Main scientific discipline in standard report		
Physics and Astronomy (all)	Natural sciences		
Physics and Astronomy (miscellaneous)	Natural sciences		
Acoustics and Ultrasonics	Natural sciences		
Astronomy and Astrophysics	Natural sciences		
Condensed Matter Physics	Natural sciences		
Instrumentation	Natural sciences		
Nuclear and High Energy Physics	Natural sciences		
Atomic and Molecular Physics, and Optics	Natural sciences		
Radiation	Natural sciences		
Statistical and Nonlinear Physics	Natural sciences		
Surfaces and Interfaces	Natural sciences		
Psychology (all)	Social sciences		
Psychology (miscellaneous)	Social sciences		
Applied Psychology	Social sciences		
Clinical Psychology	Medical and health sc.		
Developmental and Educational Psychology	Social sciences		
Experimental and Cognitive Psychology	Social sciences		
Neuropsychology and Physiological Psychology	Social sciences		
Social Psychology	Social sciences		
Social Sciences (all)	Social sciences		
Social Sciences (miscellaneous)	Social sciences		
Archaeology	Humanities, Arts		
Development	Social sciences		
Education	Social sciences		
Geography, Planning and Development	Social sciences		
Health (social science)	Social sciences		
Human Factors and Ergonomics	Medical and health sc.		
Law	Social sciences		
Library and Information Sciences	Social sciences		
Linguistics and Language	Humanities, Arts		
Safety Research	Medical and health sc.		
Sociology and Political Science	Social sciences		
Transportation	Technology		
Anthropology	Humanities, Arts		
Communication	Social sciences		
Cultural Studies	Social sciences		
Demography	Social sciences		
Gender Studies	Social sciences		
Life-span and Life-course Studies	Social sciences		
Political Science and International Relations	Social sciences		
Public Administration	Social sciences		
Urban Studies	Social sciences		
Veterinary (all)	Agricul. and forestry sc.		
Veterinary (miscellaneous)	Agricul. and forestry sc.		
Equine	Agricul. and forestry sc.		
Food Animals	Agricul. and forestry sc.		
Small Animals	Agricul. and forestry sc.		
Dentistry (all)	Medical and health sc.

The data sets and data processing

The data

This report is based on two international publication and citation databases: the three-part Science Citation Index Expanded / Social Sciences Citation Index / Arts & Humanities Citation Index (published by Thomson Reuters) and Scopus Custom Data (published by Elsevier). Because the former in practice contains the same information as the Web of Science online service, it will be referred to by means of the abbreviation WoS. For the second of the two, the report uses the shorter form, Scopus. Both databases contain references to millions of scientific publications, such as the publication's name, its authors, their affiliations, the disciplines a publication represents, the type of publication, the year it appeared and the sources used. This information serves to calculate indicators, based on publication and reference numbers that can be used to assess the scope and impact of the scientific publishing activity of research organisations. The review is restricted to the period 2000–2010.

International publication databases cannot reach key scientific output entirely in all disciplines. Coverage is good in natural sciences and medical sciences, but in social sciences and the humanities the data is often incomplete and may only cover some narrow specialist areas. Because the dominant language of science is English, the databases tend to contain references to publications in that language.

Methods

In the analyses that are undertaken in the report, each publication represents one or more scientific disciplines, as defined by the publisher, of which there are several hundred in number. A single publication is fractionalised equally among all the disciplines it represents. So that the number of disciplines that the report deals with might remain reasonable, and for the numbers of publications under scrutiny to be sufficiently large for bibliometric purposes, the publishers' disciplines are grouped further under seven main disciplines. Those used to report results are natural sciences, biological and environmental sciences, engineering and technology, medical and health sciences, agricultural and forestry sciences, social sciences and the humanities.

For the purposes of country-specific comparisons, the addresses of the authors of publications are indicated as the countries in which their affiliations are to be found (i.e. information on the research organisation the author works for or whose activities the author's publication mainly relates to). Each publication is divided equally among all the countries found under the addresses. A publication counts as being Finnish, at least partly, whenever one of the authors has given an address with the Finnish country code (usually FINLAND). The data does not allow for the identification of a single author's affiliation for the entire period under review

	Thomson Reuters WoS	Elsevier Scopus
Total number of publications 2000–2010	16,6 million	18,7 million
Finnish publications 2000–2010	121 000	122 000
Scientific disciplines 2000–2010	255	332

(2000–2010), so fractionalisation among the various countries according to the numbers of employed authors is not an option. Nor may fractionalisation be undertaken reliably with regard to numbers of affiliations located in different countries, because the data on affiliation has a relatively large number of errors or omissions, and the actual number of affiliations associated with a publication may not be read directly from the data. The country codes, however, are almost always correct.

Reliable results are obtained for Finnish affiliations, as the organisations associated with all the Finnish addresses in both databases are checked and, if necessary, corrected as comprehensively as possible. Among the Finnish organisations, publications are fractionalised on the same principle as at international level with respect to countries: each organisation mentioned in the publication's address data receives an equal share of the publication.

Regarding publication types, the examination is limited to three: *Article*, *Letter* and *Review*. The identification of a publication type relies on the publisher's classification, and in practice the same publication may be indicated as a different type in the separate databases.

The extent of the publication output for the units examined (depending on the situation, country, organisation or organisation group) is described in the report by means of two indicators: *fractionalised number of publications* and *non-fractionalised number of publications*. The fractionalised number of publications is obtained by adding together the unit's contributions to all publications it has been involved with. The non-fractionalised number of publications, on the other hand, is established by calculating the total number of publications (with no fractionalisation among the other units) that the unit has been involved with. Non-fractionalised publication numbers do not add up naturally, so, for example, the non-fractionalised number of publications for the Finnish university sector cannot be calculated as a total from the non-fractionalised number of publications for individual universities, because then the co-publications among several universities would be included in the end result over and over again.

For the purposes of citation analyses assessing the scientific impact of research, the publications

are first divided into basic categories comprising the publications representing all the same scientific discipline, publication type and year of publication. If the calculations and comparisons between basic categories are to have any meaning, the number of citations obtained for each publication must be normalised within its own basic category. The results presented in this report are based on a simple normalisation process, where the number of citations for a publication is divided by the average figure for all publications in the same basic category. This method of normalisation takes no account of the differences in the distortion of the distributions of the numbers of citations, though in practice it leads to very much the same results as more advanced normalisation processes. Where the normalised number of citations for a publication is greater than 1.0, it has attracted more references than the other publications in the same basic category, on average.

In calculating the average citation values for the data overall, excluded are those publications whose metadata makes no mention of any country (and in such cases there is also missing data on the authors). The aim has been to delete the references made by researchers to their own earlier publications. As the data does not offer any reliable means of identifying researchers, this procedure relies on the names of the authors of a publication.

The relative citation index reflecting the scientific impact of the publishing activities of a research unit is obtained by calculating the fractionalisation-weighted arithmetic mean for all the normalised numbers of citations for the publications produced by the unit. Because publications have been fractionalised among the disciplines and the units in such a way that the sum of the parts of an individual publication is always 1.0, the relative citation index obtains the value 1.0 if a unit's publications have, on average, attracted the same number of references in its own fields as all the publications in the corresponding basic categories that have been released all over the world. A relative citation index with a value greater than 1.0 means that there are more than the average number of references to a unit's publications than to similar publications produced elsewhere, and a value less than 1.0 indicates that a unit's publications have attracted less attention.

When the values for a relative citation index are being interpreted, it needs to be remembered that the distribution of references for publications is highly distorted, and the average figure alone is not enough to describe the situation accurately. A research unit whose relative citation index is high also always produces many publications that have no citations whatsoever. Equally, a unit with a low relative citation index may employ research groups that repeatedly publish a large number of articles that attract citations. The Top10 index is used to assess the contribution made by these top publications. To estimate it, the most cited tenth of publications in each basic category, as referred to above, is looked for, and these publications are given a category-specific non-zero score, with all the other publications in the category receiving a score of 0. The score for top publications is selected in such a way that the average score in each basic category is exactly 1.0. After that the parts-weighted arithmetic mean for the scores for each research unit's publications is recalculated, though now of course only the publications in the most cited tenth produce a result for the units. As with the relative citation index, a Top10 index value of 1.0 also means that the share of top publications in the research unit's output is equal to the world average (10%), and index values greater than 1.0 mean that the share of top publications in its output is greater than 10%.

With the indices describing impact, the principle followed has been that the results are not reported when the number of publications for a unit being analysed is fewer than 100. Indicators for small units can fluctuate greatly from one year to the next, for example when one publication among a whole group attracts a large number of citations.

Bibliometric calculations are performed in accordance with two fundamental principles. Firstly, all calculation algorithms must be generally symmetric with parameters in a similar position. This means that, for example, all disciplines are dealt with identically, and the same is true for all countries. Finland, especially, is therefore not a country in any special situation, even though Finnish affiliations can be identified more reliably

than foreign ones. Furthermore, at the organisation level, all Finnish organisations are treated identically. Although the goal is symmetry with respect to methods used, it nevertheless needs to be remembered that the data available is not symmetric for disciplines any more than it is for countries or organisations.

Secondly, the results must be consistent with regard to aggregations for publication categories. If the smaller publication categories are combined into bigger entities, the number of publications associated with the combined category must be the sum total for publications for the smaller categories, and each citation indicator value in the combined category should always be within the range of variation for the values calculated in the smaller categories for the same indicator. A significant exemption from the consistency principle is the use of non-fractionalised publication numbers. Citation indicators are always based on fractionalised publication numbers, so they are consistent. At the global level, consistency means that the average for each citation indicator (weighted by numbers of publications) across all countries in the world receives the value 1.0.

Indicator calculation formulae

For the purposes of country-specific analyses, each publication is fractionalised evenly with regard to all the disciplines it represents and the countries mentioned in its address information. If a publisher has given a publication D x scientific fields, with the authors coming from M different countries, the contribution made by one country in one field is $f=1/(MK*D)$. For a comparison of Finnish organisations, the Finnish national contribution is still fractionalised evenly among all the identified organisations. If there are N organisations, the contribution by just one organisation in one field is $f=1/(M*D*N)$.

When calculating the relative citation index, a publication is dealt with fractionalised. Let the index group for the fractionalised publications of a research unit under scrutiny be I . One bona fide publication may thus appear in this group more than once, if it represents several different fields. For a publication

in a field represented by its $i \in I$, first the normalised citation figure is calculated for the citation figure r_i by dividing the number of citations c_i derived from it by the average number of citations for the basic category G_i determined for the same field, year of publication and publication type a_p , thus $r_i = c_i / a_p$. Now let the discipline-specific contribution calculated in the way shown above for a publication be f_i . The relative citation index for research unit ρ is obtained by calculating the arithmetic mean weighted by contributions for the normalised citation values for all a unit's publications: $\rho = \sum_{i \in I} f_i^* r_i / \sum_{i \in I} f_i$.

The Top10 index is calculated along the same lines, but now the normalised citation figure r_i is replaced by the score $p_i > 0$, if the publication is included in the most cited tenth for basic category G_p , and, if not, with the value 0. A figure's p_i value depends on the size of the category G_i and on the number of publications in the category's most cited tenth, and is selected in each category in such a way that the category's score will be exactly 1.0.
